District of Columbia - Department of Health Care Finance

2012 Annual Technical Report

Executive Summary

Introduction

The District of Columbia (the District) Department of Health Care Finance (DHCF) is the single state agency responsible for managing the District's Medicaid program which provides healthcare coverage to low-income children, adults, elderly, and persons with disabilities. As of December 2012, nearly 150,000 Medicaid enrollees were receiving healthcare services through one of two managed care organizations (MCOs) or one pre-paid inpatient health plan (PIHP)¹ that contracts with DHCF to manage the healthcare of Medicaid beneficiaries. In addition to Medicaid, DHCF administers the District's Health Care Alliance program², with approximately 12,500 Alliance members. Unlike Medicaid, this program is paid for entirely with local government dollars. Lastly, just over 1,900 additional enrollees were served by a new MCO that began participation in the District's managed care program in November 2012. The services provided by this MCO are not included in this report.

As the single agency responsible for managing the District's Medicaid program, DHCF is charged with ensuring that Medicaid beneficiaries receive care that is of high quality, accessible, and timely. To ensure this, DHCF mandates that MCOs:

- Achieve 100% compliance with federal and contractual operational requirements;
- Conduct ongoing quality improvement initiatives and submit performance results;
- Calculate and submit valid and reliable Healthcare Effectiveness Data and Information Systems (HEDIS®)³ and Consumer Assessment of Healthcare Providers and Systems (CAHPS®)⁴ data; and
- Attain National Committee for Quality Assurance (NCQA) accreditation.

DHCF's Strategic Plan for fiscal years (FY) 2012-2014 describes its goals in support of its mission "to improve health outcomes for residents of the District of Columbia by providing access to a comprehensive and cost-effective array of quality health care services." In addition, DHCF's Performance Plan established in

¹ The PIHP serves SSI eligible Medicaid members age 0-26 years.

² The DC Healthcare Alliance is a public program that provides free healthcare to individuals and families who live in the District, have no health insurance, and earn less than 200% of the federal poverty level (FPL).

³ HEDIS® is a registered trademark of the National Committee for Quality Assurance (NCQA).

⁴ CAHPS® is a registered trademark of the Agency for Healthcare Research and Quality (AHRQ).

FY 2011 sets forth specific initiatives aimed at attaining the District's quality goal to improve health outcomes for residents and to support the MCOs' efforts to improve the quality of care and services provided to Medicaid enrollees.

Four key initiatives pertinent to managed care are set forth in the Performance Plan and remain relevant for Calendar Year (CY) 2012:

- 1) Improve birth and perinatal outcomes in the Medicaid program;
- 2) Launch a resource website for case managers and perinatal providers;
- 3) Reduce adverse outcomes for people with chronic illnesses; and
- 4) Produce a Consumer Report Card to facilitate beneficiary choice in managed care.

In May 2012, DHCF issued a request for proposals for re-procurement of managed care services for the District's Medicaid and Alliance members. As a result of the procurement activities, it is important to note that the two MCOs providing services in CY 2012, which are the subject of this evaluation, exited the District's managed care program on June 30, 2013. Beginning July 1, 2013, the District implemented contracts with 3 new MCOs to provide healthcare services to District residents. In addition to the new MCOs, the PIHP, designated as MCO B in this report, will continue serving the District's SSI residents.

Purpose

Federal regulations require that states contracting with managed care plans ensure that organizations, independent of both the District and the managed care plans perform an annual external review of the quality, timeliness, and access to health care services furnished by each managed care plan. In fulfillment of this requirement, DHCF contracts with the Delmarva Foundation for Medical Care, Inc. (Delmarva) to serve as the external quality review organization (EQRO). This report describes the review activities conducted by Delmarva during CY 2012-2013, the methods used to aggregate and analyze information from the review activities, and draws conclusions as to the quality, timeliness, and access to healthcare services furnished by Medicaid managed care plans in the District of Columbia during CY 2012.

Methodology

Federal regulations require that three mandatory activities be performed by the EQRO using methods consistent with protocols developed by the Centers for Medicare and Medicaid Services (CMS) for conducting the activities.⁵ These protocols specify that the EQRO must conduct the following activities to assess managed care performance:

- 1) A review conducted within the previous 3-year period to determine the MCOs' compliance with standards established by DHCF to comply with the requirements of 42 C.F.R. § 438.204(g), as well as

⁵ The protocols can be downloaded at: <http://www.medicaid.gov/Medicaid-CHIP-Program-Information/By-Topics/Quality-of-Care/Quality-of-Care-External-Quality-Review.html>

applicable elements of the MCOs' contracts with DHCF. The MCOs are responsible for addressing any recommendations or opportunities for improvement made by the EQRO.

- 2) Validation of DHCF required performance measures; and
- 3) Validation of DHCF required performance improvement projects (PIPs) that were underway during the prior 12 months.

As the EQRO, Delmarva conducted each of the required activities in a manner consistent with the protocols. Comprehensive MCO operational systems compliance reviews were conducted in the prior year. Therefore, the EQRO review activities for the current reporting period are focused on evaluating the actions undertaken by the MCOs to address identified areas of non-compliance and recommendations for improvement.

In addition to the mandatory review activities, Delmarva conducted an analysis of MCOs' reported HEDIS and CAHPS results, as well as an assessment of DHCF's progress in meeting goals set forth in its FY 2011 Performance Plan.

In aggregating and analyzing the data, Delmarva allocated standards and/or measures from each activity to domains indicative of quality, access, or timeliness to care and services. A detailed description of the methods used to conduct the activities can be found in Section I of this report. Separate report sections address each specific domain and describe the methodology and data sources used to draw conclusions for the particular area of focus. The final report section summarizes findings and recommendations to DHCF and the health plans to further improve the quality of, access to, and timeliness of health services for Medicaid members.

Findings

Quality

Operational Systems

The previous comprehensive operational systems review noted that the participating MCOs had quality systems and procedures in place to promote high quality care with well-organized approaches to quality improvement. The MCOs operated strong Quality Assessment and Performance Improvement (QAPI) programs that included annual planning, participation from providers and MCO leadership, and provided for on-going assessment of quality improvement activities. Measurement, follow-up, and reporting were evident across the organizations based on discussions with staff, reports reviewed, and presentations of activities. There were no recommendations or opportunities for improvement identified in the CY 2011 report in regards to operational systems associated with quality, and requiring follow-up in CY 2012-2013.

Performance Improvement Projects and Performance Measures Validation

Recognizing the impact of chronic illnesses and poor birth outcomes on both cost and quality of life for District residents, DHCF and the MCOs work collaboratively on efforts to reduce adverse health outcomes for Medicaid members enrolled in MCOs. Collaborative goals are aimed at reducing adverse perinatal outcomes such as prematurity, low birth weight, and infant deaths. The chronic care collaborative goals are focused on reducing emergency department and inpatient utilization for enrollees with diabetes, asthma, congestive heart failure, and hypertension.

Delmarva validates the accuracy and reliability of the MCOs' performance measures reported in conjunction with the collaborative performance improvement projects (PIPs), *Improving Perinatal and Birth Outcomes* and *Adverse Outcomes of Chronic Diseases*. Delmarva validated the MCOs' processes for conducting PIPs and their reported rates for the collaborative PIPs that were underway during CY 2012. Although MCO A submitted its PIP report for evaluation, it did not participate in validation of its processes for programming and calculating the PIP indicator rates as it was preparing to exit the District's Medicaid managed care program at the time audit activities were underway.

Goals for reduction in adverse health outcomes were set at the outset of the initiatives and are measured annually. The goal for reducing adverse perinatal outcomes for MY 2012 is set at <210 adverse events per 1,000 members. It is important to note that a single pregnancy could potentially result in multiple adverse events. Adverse perinatal outcomes are defined as:

- Miscarriage or fetal loss;
- Neonates weighing <2500 grams;
- Neonates with a gestational age <32 weeks;
- Pregnancies for which the outcome is unknown;
- Lack of maternal HIV testing; and
- Death of an infant age 0-365 days.

Although MCO A submitted unvalidated data for the perinatal measures, the reported rate appears consistent with previously reported data. Therefore, a District weighted average was calculated for the perinatal measure. The District rate for adverse birth outcomes for MY 2012 is 180 adverse events per 1,000 members, meeting the collaborative goal.

The goal for adverse events related to chronic diseases is set at < 450 per 1,000 members for MY 2012. An adverse event is defined as an emergency department visit or an acute inpatient hospitalization. An individual could potentially have multiple adverse events contributing to the rate. Data submitted by MCO A does not appear to be valid and reliable when compared to previously reported rates. Therefore, a District rate was not calculated. However, based on validated data submitted by MCO B and MCO C, it does not appear that the chronic diseases collaborative would have achieved its goal to reduce emergency department and inpatient

hospital utilization for MY 2012. Individually none of the MCOs met the goal of <450 adverse events per 1,000 members for chronic diseases.

HEDIS and CAHPS

A subset of HEDIS effectiveness of care measures was also used to assess MCO performance in the area of quality. These measures include comprehensive care for diabetics, controlling high blood pressure, and appropriate use of medications for people with asthma. Analysis of the HEDIS measures found that although the MCOs' rates for these measures improved over MY 2011, the MCOs continue to perform below the national Medicaid averages on almost all measures for members with diabetes and hypertension.

A subset of CAHPS measures were chosen by Delmarva as representative of consumers' perceptions of quality. These measures include:

- Customer service,
- How well doctors communicate,
- Coordination of care,
- Rating of health plan,
- Rating of all health care,
- Rating of personal doctor, and
- Rating of specialist.

Only two of the three participating MCOs conducted adult and child CAHPS surveys for MY 2012. MCO A did not conduct the survey as it was preparing to exit the Medicaid market at the time the surveys would have been performed. Since MCO A provided services to approximately two-thirds of the District's managed care enrollees for MY 2012, a District average was not calculated for MY 2012 as it would not accurately reflect the District's Medicaid managed care population.

MCO B conducted the adult CAHPS survey for the first time in CY 2012. Prior to this, MCO B did not have a large enough adult population to conduct the surveys. MCO B achieved >80% satisfaction ratings by its members and exceeded the national Medicaid average in 6 of the 7 measures of adult satisfaction. For the child survey, MCO B exceeded the national Medicaid average in 5 of the 7 measures and exceeded an 80% satisfaction level in 6 of the measures. MCO B scored highest in how well doctors communicate and customer service for both the adult and child surveys.

MCO C exceeded the national Medicaid average in 3 of the 7 measures and exceeded 80% satisfaction for 3 of the measures. For the child survey, MCO C exceeded the national Medicaid average in 3 of the 7 measures and exceeded the 80% satisfaction level for 5 of the 7 measures. For both surveys, MCO C performed best in how well doctors communicate.

Strategic Plan

In regards to DHCF's goals, DHCF met its performance plan goals for improving perinatal and birth outcomes but did not achieve its goal for reducing adverse events of chronic diseases. Production of the consumer report card was deferred to FY 2015 when new health plans will have reliable data available for reporting.

Access*Operational Systems*

An evaluation of the MCOs' operational systems relative to access conducted in the prior year found that all MCOs conduct on-going analysis of the adequacy of provider networks, both for primary and specialty care. Member utilization of services and geo-access reports are used to identify providers with open networks to ensure that adequate numbers of providers are available to meet the needs of the population. Members receive information regarding providers, hours of operations, and the availability of transportation and translation services.

The MCOs have policies and procedures in place that promote access to women's health services and services for members with special needs through direct access to specialists. Care coordination and disease management programs are aimed at identifying members with special needs, or those who are non-compliant with care, to provide additional assistance in accessing needed services and improving health status.

There were no recommendations or opportunities for improvement identified related to the MCOs' operational systems requiring action or follow-up during CY 2012-2013.

HEDIS and CAHPS

HEDIS measures of adult and child access to preventive/ambulatory health services were used to evaluate outcomes for members relative to access. For adults, in all age ranges, access to preventive/ambulatory health services fell below the national HEDIS Medicaid average. Both breast cancer and cervical cancer screening rates exceeded the national Medicaid average.

MCOs should assess barriers to care that may be limiting access to preventive services for members. Dependent upon the barrier analysis, expansion of primary care office hours and increased member education and outreach efforts may be effective interventions.

The District performed well in measures of access for children and adolescents, particularly in lead screening, adolescent well visits, and dental visits. Annual dental visits improved by nearly 3 percentage points and exceeded the national Medicaid average. Adolescent well care visits exceeded the national Medicaid average, as did lead screening for children and immunizations for adolescents (Combo 1).

The CAHPS adult satisfaction with “getting needed care” fell below the national Medicaid average for both MCO B and C. Parent/guardian satisfaction with “getting needed care” for child enrollees also fell below the national Medicaid average for MCO B and C but exceeded 80% for both MCOs. MCO A did not conduct adult or child CAHPS for MY 2012.

Timeliness

Operational Systems

MCOs must have procedures in place to make timely decisions in order to not disrupt or delay the provision of care or services to their members. An evaluation of the MCOs’ operational systems in the previous year relative to timeliness found that all MCOs monitor authorization decisions for timeliness. Turn-around time is measured and documented with results summarized and reported to the utilization and quality management committees. The health plans were able to demonstrate that there are policies and procedures in place to address timeliness standards for availability of appointments.

All MCOs that failed to achieve 100% compliance on operational standards for CY 2011 were required to submit an action plan indicating the steps they will take to resolve the non-compliant issues. The action plans are reviewed and approved by Delmarva. Once an acceptable action plan has been approved, Delmarva requires the MCOs to submit periodic updates regarding implementation of the action plans. Any revisions to policies and procedures are reviewed as well as MCO generated reports to show evidence of compliance with the requirements. All three MCOs submitted action plans per requirements and all identified issues were resolved or the MCO had exited the District Medicaid market.

HEDIS and CAHPS

HEDIS measures for timeliness of prenatal care and the frequency with which pregnant women accessed on-going prenatal care (the number of expected prenatal visits) were used to evaluate member outcomes relative to timeliness of services. Improvement in these measures could potentially result in decreased rates of prematurity and low birth weight infants. The District’s weighted average fell short of the national Medicaid averages for both measures. However, those women receiving $\geq 81\%$ of the recommended number of prenatal visits improved by over 4 percentage points over MY 2011.

CAHPS results for adult satisfaction with getting care quickly fell below the National Medicaid average for both MCO B and MCO C. Parent/guardian satisfaction with “getting care quickly” for children exceeded 80% for MCO C but fell below the National Medicaid average. MCO B exceeded the National Medicaid average and had a greater than 90% satisfaction rating for this measure. As previously stated, MCO A did not conduct the adult or child CAHPS.

Status of Recommendations from Prior Year

MCOs

As a result of the CY 2011 review activities several recommendations for improvement were made to the MCOs. The MCOs were expected to act on the recommendations during CY 2012. The status of each recommendation is addressed below:

- MCOs must ensure that written policies and procedures encompass all required federal and contractual language. During the CY 2011 review, MCO A was found to be non-compliant with requirements for timely notification to members when availability of after-hours services changed and for timely notifications of denials in accordance with the District's requirements. An action plan was developed and implemented by MCO A and this issue was resolved.

MCO B did not meet requirements for notifying members of changes to the provider network in a timely manner and did not meet requirements for timely notification of denials in accordance with the District's requirements. An action plan was developed and implemented. Monitoring of reports indicate that these issues have been resolved.

MCO C did not meet requirements for its providers for timely access to care and services, taking into account the urgency of need for services. An evaluation of the MCO's provider surveys found that appointments for asymptomatic health assessments including adult physicals and EPSDT services were compliant only 70% of the time for appointments within 3 weeks. Appointments for routine symptomatic care were available within 10 business days 80% of the time. MCO C also did not meet timeliness requirements for resolving grievances. An action plan was developed and implemented.

- MCOs must ensure that PIP activities include a robust analysis of performance for each indicator and tie results to specific interventions. This should include a drill down of data to develop system-wide interventions that may help to sustain improvement. MCOs submitted CY 2012 PIP reports to Delmarva in July 2013 for review and evaluation. By this point in time, two of the MCOs (MCO A and MCO C) participating in CY 2012 activities had been notified that they did not successfully secure new DHCF contracts to provide services to the District's Medicaid enrollees. Therefore, more robust analysis of PIP data was not undertaken by these two MCOs. MCO B continued to conduct robust data analysis of PIPs results and to develop multi-faceted approaches to quality improvement based on data findings.
- MCOs should evaluate HEDIS outcomes measures in relationship to PIP results. Two of the MCOs (MCO A and MCO C) participating in CY 2012 activities were notified that they did not successfully secure new DHCF contracts to provide services to the District's Medicaid enrollees. Therefore,

evaluation of HEDIS outcomes measures in relationship to PIP results were not undertaken by these two MCOs. However, within its PIP report, MCO B did include HEDIS data relative to the PIP indicators.

- MCOs should set goals and develop interventions to achieve, at a minimum, the Medicaid average for HEDIS comprehensive diabetes care and controlling high blood pressure measures. All three (3) MCOs improved in nearly all HEDIS measures comprehensive diabetes care. MCO B and MCO C also improved in the controlling high blood pressure measure. MCO A did not submit HEDIS data for controlling high blood pressure.
- MCOs should conduct a root cause analysis tied to CAHPS results to identify reasons for member dissatisfaction, particularly in the areas of customer service and care coordination. MCO A did not conduct a CAHPS survey for CY 2012. MCO B improved in both both care coordination and customer service in its child population. CY 2012 was the first year that MCO B had a large enough population to field the adult survey. MCO C improved in care coordination and customer service in both the child and adult populations.

DHCF

As a result of EQRO activities conducted for CY 2011, Delmarva made the following recommendations to DHCF for program improvement:

- Consider designing and implementing a robust value-based purchasing plan consisting of incentives/disincentives based on MCOs' performance across a designated set of performance measures. DHCF is actively working with its actuary to develop a value-based purchasing program. DHCF began contracting with three (3) new MCOs on July 1, 2013. Therefore, it is not expected that data will be available until FY 2015 to implement a value-based purchasing program.
- Choose a subset of HEDIS, CAHPS, and operational measures that align with DHCF's Strategic Plan and set specific goals against which MCO performance will be assessed annually. These should include goals such as adult access to preventive services, child access to preventive services, quality outcomes related to chronic illnesses, care coordination, and member satisfaction.
- Use performance against the designated measures as the basis for a consumer report card. DHCF plans to implement the consumer report card in FY 2015 when data becomes available.
- Re-evaluate the current collaborative PIP structure to expand the stakeholders group and add measures more closely tied to health outcomes. The collaborative PIP efforts include monthly meetings with stakeholders who have a direct interest in improving health outcomes in the District, among these are MCOs, physicians, clinics, hospitals, and special interest organizations like the American Diabetes Association. The purpose of these stakeholder meetings is to identify resources and potential interventions that promote improved health outcomes. Over the course of the collaborative activities, stakeholder participation has declined. In order to effect system-wide improvement it is important to

receive input and recommendations from a wide variety of service providers. DHCF began working with the newly contracted MCOs in September 2013 to restructure the collaboratives and revise the measure indicators. Several local asthma coalitions have begun actively participating in the collaborative work groups.

- Consider gauging MCO performance separately for the collaborative PIPs. Aggregation of results may be skewed by including rates from one MCO that only serves a special needs population. This recommendation remains under consideration by DHCF and the collaborative work group.

As noted above, DHCF is actively working to address the recommendations from CY 2012. However, implementation of program changes that may result from these recommendations are not expected to occur until FY 2015. DHCF issued a request for proposals in CY 2012 to procure new MCO contracts. New MCOs began program participation in July 2013. It is not expected that MCOs will have adequate data available to implement incentive based performance or a consumer report card until FY 2015. DHCF is currently reviewing its Strategic Plan for possible revisions to include performance goals for HEDIS and CAHPS measures, a value-based purchasing plan, and use of a consumer report card.

In regards to the collaborative PIPs, DHCF continues to require MCOs to participate in two collaborative PIPs. Both collaborative work groups are focused on reviewing and potentially revising the PIP focus and indicators. Additional stakeholders have been identified and have begun actively participating in collaborative efforts to re-structure the PIPs. DHCF, in conjunction with the work groups, will determine whether separate MCO rates for the indicators will be reported versus an overall District rate dependent upon the final indicators chosen. It is expected that CY 2014 data, which will be reported in June 2015, will be used to construct baseline rates for both collaboratives.

Opportunities for Improvement

Recommendations for MCOs

Although each health plan is committed to delivering high quality care and services to its managed care members, opportunities exist for continued performance improvement. As MCO A and MCO C will no longer be participating in CY 2013, recommendations are made only for MCO B. The status of these recommendations will be included in the CY 2013 Annual Technical Report. Based upon the evaluation of 2012 activities, Delmarva developed the following recommendations for MCO B:

- Renew efforts to obtain stakeholder involvement in the collaborative PIPs.
- Identify and leverage current quality improvement efforts underway in the District that support the collaborative aims.
- Tie proposed interventions to data points to enable analysis of the effectiveness of the interventions.

Recommendations for DHCF

As new health plans begin providing healthcare services to District residents, it will be important for DHCF to:

- Set performance improvement goals for each MCO for key PIP indicators. This will improve MCO accountability and engagement in collaborative efforts.
- Require that each collaborative identify at least one intervention that will be conducted jointly by the MCOs.
- Consider expanding the perinatal collaborative indicators to include a new measure of deliveries prior to 39 weeks gestation.
- Set minimum performance goals for health plans on select HEDIS and CAHPS measures. These should include an array of measures pertinent to the District's enrolled managed care population. In particular, we would recommend that measure goals be set for diabetes and prenatal care.

The status of these recommendations will be discussed in the CY 2013 Annual Technical Report.

Section I – Overview

Introduction

The District of Columbia (the District) Department of Healthcare Finance (DHCF) is the single state agency responsible for managing the District’s Medicaid program which provides healthcare coverage to low-income children, adults, elderly, and persons with disabilities. As of December 2012, nearly 150,000 Medicaid enrollees were receiving healthcare services through one of two managed care organizations (MCOs) or one pre-paid inpatient health plan (PIHP) that contracts with DHCF to manage the healthcare of Medicaid beneficiaries. In addition to Medicaid, DHCF administers the District’s Health Care Alliance program⁶, with approximately 12,500 Alliance members not eligible for Medicaid receiving services through these same MCOs as of December 2012. Unlike Medicaid, this program is paid for entirely with local government dollars.

In May 2012, DHCF issued a request for proposals for re-procurement of managed care services for the District’s Medicaid and Alliance members. As a result of the procurement activities, it is important to note that the two MCOs providing services in CY 2012, which are the subject of this evaluation, exited the District’s managed care program on June 30, 2013. Beginning July 1, 2013, the District implemented contracts with 3 new MCOs to provide healthcare services to District residents. In addition to the new MCOs, the PIHP, designated as MCO B in this report, will continue serving the District’s SSI residents.

DHCF requires that MCOs providing services to managed care beneficiaries are National Committee for Quality Assurance (NCQA) accredited. NCQA health plan accreditation includes two major components—an evaluation of the plan’s structure and processes to maintain and improve quality and an evaluation of the plan’s performance on process and outcomes measures related to clinical care and member satisfaction. NCQA accreditation has been widely recognized by both federal and state regulators as the gold standard for health plan operations, and information from the NCQA accreditation activities is often used to augment state strategies for assessing health plan performance.

The Code of Federal Regulations (CFR) (42 CFR § 438.202(a)) requires that each state contracting with an MCO or PIHP must have a written strategy for assessing and improving the quality of managed care services. DHCF’s Strategic Plan for fiscal years (FY) 2012-2014 describes its goals in support of its mission “to improve health outcomes for residents of the District of Columbia by providing access to a comprehensive and cost-effective array of quality health care services”⁷.

⁶ The DC Healthcare Alliance is a public program that provides free healthcare to individuals and families who live in the District, have no health insurance, and earn less than 200% of the federal poverty level (FPL).

⁷ Department of Health Care Finance FY2012-2014 Strategic Plan Available at:
<http://dhcf.dc.gov/sites/default/files/dc/sites/dhcf/publication/attachments/DHCFStrategicPlanFY12-14.pdf>

In FY 2011, DHCF also established a Performance Plan that sets forth specific initiatives aimed at achieving its overarching goal to improve health outcomes for District residents and to support the MCOs' efforts to improve the quality of care and services provided to Medicaid enrollees.⁸ Delmarva also assessed DHCF's progress in meeting its strategic goals for four key initiatives pertinent to managed. These performance indicators include:

- 1) Improve birth and perinatal outcomes in the Medicaid program;
- 2) Launch a resource website for case managers and perinatal providers;
- 3) Reduce adverse outcomes for people with chronic illnesses; and
- 4) Produce a Consumer Report Card to facilitate beneficiary choice in managed care.

Detailed findings on DHCF's progress in meeting its quality goals can be found in *Section II - Quality* of this report.

Federal regulations (42 CFR Part 438 Subpart E) require that states contracting with managed care plans ensure that organizations, independent of both the District and the managed care plans, perform an annual external review of the quality, timeliness, and access to health care services furnished by each managed care plan. Protocols⁹ describing mandatory and optional activities were issued by the Centers for Medicare and Medicaid Services (CMS) in 2002 and were updated in 2012. These protocols specify three mandatory activities that must be conducted to assess managed care performance. The mandatory activities include:

- 1) A review conducted within the previous 3-year period to determine the MCOs' compliance with standards established by the State to comply with the requirements of 42 C.F.R. § 438.204(g), as well as applicable elements of the MCOs' contracts. The MCOs are responsible for addressing any recommendations by the EQRO based on the findings and recommendations in the following year.
- 2) Validation of State required performance measures; and
- 3) Validation of State required performance improvement projects (PIPs) that were underway during the prior 12 months.

In fulfillment of this requirement, DHCF contracts with the Delmarva Foundation for Medical Care, Inc. (Delmarva) to serve as the external quality review organization (EQRO).

⁸ FY 2011 Performance Plan, Department of Healthcare Finance. Available at: <http://oca.dc.gov/sites/default/files/dc/sites/oca/publication/attachments/DHCF11.pdf>

⁹ The updated EQR Protocols are available for download at: <https://www.cms.gov/Regulations-and-Guidance/Legislation/PaperworkReductionActof1995/PRA-Listing-Items/CMS-R-305.html>

Purpose

Federal regulations require that the EQRO aggregate information obtained through the mandatory review activities and produce an annual technical report to the District describing the MCOs' performance and the District's progress in meeting its quality goals. This report describes the activities conducted by Delmarva, the methods used to aggregate and analyze information from the review activities, and draws conclusions as to the quality, timeliness, and access to healthcare services furnished by Medicaid managed care plans in the District of Columbia during CY 2012. In addition, the report includes findings related to the District's performance in meeting its strategic goals.

Methodology

As previously noted, federal regulations require that three mandatory activities be conducted by the EQRO using methods consistent with the EQRO Protocols developed by CMS. As the EQRO, Delmarva conducted each of the required activities in a manner consistent with the protocols. The processes for completing these activities are described below.

Structure and Operational Systems

The purpose of the structure and operational systems review is to assess MCO performance against the federal regulatory requirements and DHCF contractual requirements. Key areas of focus include:

- Enrollee Rights and Protections (ER) - 42 CFR § 438 Subpart C, Enrollee Rights and Protections, details requirements to ensure that managed care enrollees have the right to receive information about available health care services, how to access services, policies and procedures relative to obtaining services, and the right to make health care decisions.
- Grievance Systems (GS) - 42 CFR § 438 Subpart F, Grievance Systems, mandates that each MCO has in effect a grievance system that meets specific requirements to ensure notification of enrollees in a timely manner for all types of grievances and appeals. Access to a grievance system affords enrollees with the right to express dissatisfaction with care or services provided by the MCO or its providers and the ability for MCOs to potentially identify issues that need to be addressed (e.g. requesting payment from enrollees, inappropriate denial of payment or services).
- Quality Assessment and Performance Improvement (QA) - 42 CFR § 438 Subpart D, Quality Assessment and Performance Improvement, sets forth MCO specifications for quality strategies to ensure the delivery of high quality health care and customer service. MCOs must measure performance (e.g. immunization rates, preventive screening rate) and use their data to improve the quality of services provided to enrollees through quality of care studies and other activities. Standards for quality, access,

and timeliness of care are defined and MCOs must monitor these to ensure enrollees receive the benefits and services to which they are entitled.

The annual structure and operational systems review is conducted in accordance with the EQRO Protocol, *Assessment of Compliance with Medicaid Managed Care Regulations*, using a systematic approach consisting of pre-site, on-site, and post-site activities.

A comprehensive operational systems review of each MCO was conducted in CY 2012 with findings reported in the CY 2011 Annual Technical Report. During the first two quarters of CY 2013 Delmarva assisted the MCOs in preparing action plans in response to identified opportunities for improvement. Delmarva also conducted monitoring activities and reviewed supporting documentation to ensure that areas noted for improvement were actively addressed and resolved by the MCOs.

Validation of Performance Measures

The validation of performance measures activity is conducted in accordance with the EQRO Protocol, *Validation of Measures Reported by MCOs*, using a systematic approach consisting of pre-site, on-site, and post-site activities. There are two primary objectives associated with the validation process:

- 1) To evaluate the accuracy of the performance measures reported by the MCO and
- 2) To determine the extent to which the MCO followed the specifications required by the District for calculating the performance measures.

Key validation activities include:

- Review of data systems and processes used by the MCO to construct the measure rates;
- Assessment of the calculated rates for algorithmic compliance to defined specifications; and
- Verification that the reported rates are based on accurate sources of information.

Pre-Site

The validation process begins with a conference call between the audit team, MCOs and DHCF to confirm the measures and specifications to be used in the audit. Next, each MCO completes and submits its Information Systems Capabilities Assessment (ISCA), which describes the MCO's data systems for collecting valid, accurate data, and then calculating and reporting quality improvement data. The auditors evaluate the information in the ISCA for consistency with findings reported in previous assessments of the MCO's systems, and a site visit date is set. A tentative agenda is developed and a summary of ISCA issues is compiled.

On-Site

The validation team conducts an onsite visit to the MCO to investigate any potential issues identified through review of the ISCA document and to observe the systems and procedures used by the MCO to collect and

produce measure data. The members of the validation team hold an entrance meeting with the MCO staff to describe the validation purpose, scope, necessary documentation, and to identify staff to be interviewed. These staff interviews provide insight into the accuracy and reliability of the reporting processes by allowing the health plan to clarify and provide more detail on any issues identified through the auditor's review of the ISCA.

During the onsite visit, the auditors review the information systems structure, protocols and procedures, and measure specific data collection methods. A preliminary review of the source code the MCO intends to use to produce the measures is also conducted. At the conclusion of these activities, the auditor meets with the MCO staff to review preliminary findings, request additional documentation if necessary, and provide guidance on areas requiring action.

Post-Site

Following the onsite visit, any action items are forwarded to the MCO in the form of a preliminary validation report. The MCO must demonstrate that it has the automated systems, information management practices, and data control procedures needed to ensure that all information required for performance measures reporting is adequately captured, translated, stored, analyzed, and reported. All outstanding issues must be resolved prior to the MCO calculating its final performance measures rates. A review and approval of the final source code is performed prior to the MCO calculating its final rates.

A final validation report is produced detailing MCO performance against information systems standards and measure specifications. Standards are assigned designations: Fully Compliant, Substantially Compliant, Not Valid, or Not Applicable to the MCO's measures. A final measure designation is assigned—Reportable or Not Reportable.

DHCF contracts with Delmarva to validate the accuracy and reliability of the MCOs' performance measures reported in conjunction with its mandated performance improvement projects (PIPs), *Improving Perinatal and Birth Outcomes* and *Adverse Outcomes of Chronic Diseases*. Delmarva validated two of the three MCOs' measures rates for the collaborative PIPs that were underway during CY 2012. MCO A did not participate in validation activities. The MCO was undergoing acquisition by a new MCO and preparing to exit the District's Medicaid managed care program at the time audit activities were underway. Hence, Delmarva cannot attest to the accuracy and reliability of MCO A's reported collaborative performance measures rates.

Validation of Performance Improvement Projects

Delmarva's PIP review methodology is based upon the CMS protocol, *Validating Performance Improvement Projects*. The validation is aimed at evaluating whether or not the PIPs are designed, conducted, and reported in a sound manner and the degree of confidence DHCF can have in the reported results.

Each MCO is required to provide the study framework and project description for each PIP at the onset of the projects. This information is reviewed to ensure that each MCO is using relevant and valid study techniques. The MCOs are required to provide updates on the progress of their PIPs in July of each year. The submissions include results of measurement activities, a status report of intervention implementations, analysis of the measurement results using the MCO's data analysis plan as described in its PIPs, as well as information concerning any modifications to (or removal of) intervention strategies that may not be yielding anticipated improvement. If an MCO decides to modify other portions of the project, updates to the submissions are permitted in consultation with Delmarva.

Delmarva's PIP reviewers evaluate each project submitted using a standard validation tool that employs the CMS validation methodology. This includes assessing each project in ten critical areas noted in Table I-1.

Table I-1. 10-Step PIP Review Process

Step	Description
1	Assess the Study Topic - The study topic/project rationale must include demographic characteristics, prevalence of disease, and potential consequences (risks) of disease. MCO specific data must support the study topic and demonstrate the need for the PIP.
2	Review the Study Question(s) - The study question should reference the study population, activity, and expected outcome. The study question guides the PIP and must be clear and answerable.
3	Review the Selected Study Indicator(s) - The study indicator(s) must be meaningful, clearly defined, and measurable.
4	Review the Identified Study Population - The study population must reflect all individuals to whom the study questions and indicators are relevant.
5	Review Sampling Methods - The sampling method must be valid and protect against bias.
6	Review Data Collection Procedures - The data collection procedures must use a systematic method of collecting valid and reliable data.
7	Assess Improvement Strategies - The improvement strategies, or interventions, must be reasonable and address barriers on a system-level.
8	Review Data Analysis & Interpretation of Study Results - The study findings, or results, must be accurately and clearly stated.
9	Assess Whether Improvement is Real Improvement - Project results must demonstrate real improvement.

Step	Description
10	Assess Sustained Improvement - Sustained improvement must be demonstrated through repeated measurements.

As Delmarva conducts PIP reviews, each component within a step is rated as *Yes*, *No*, or *Not Applicable*. Components are then collectively reviewed to arrive at a determination of:

- Met – All required components are present.
- Partially Met – At least one, but not all components are present.
- Unmet – None of the required components are present.
- Not Applicable – None of the components are applicable.

Delmarva validated the MCOs' collaborative PIPs, *Improving Perinatal and Birth Outcomes* and *Adverse Outcomes of Chronic Diseases*, which were underway during CY 2012. A description of the collaborative PIPs and the measures specifications can be found in Appendix 1 and 2.

HEDIS/CAHPS Measures

Healthcare Effectiveness Data and Information Systems (HEDIS®)¹⁰ and Consumer Assessment of Healthcare Providers and Systems (CAHPS®)¹¹ measures have become an invaluable evaluation tool used by over 90% of health plans nationally. Because the District requires MCOs to report HEDIS and CAHPS measures and many health plans across the nation collect this data, it is possible to compare health plan performance among DHCF contracted health plans as well as to national Medicaid benchmarks.

HEDIS measures are designed to provide information to reliably compare the performance of health care plans across a wide array of clinical health care measures. These measures focus heavily on areas such as prenatal and postpartum care, child health preventive care such as well child visits and immunizations, management of chronic diseases, and access to care. CAHPS measures specifically address consumers' satisfaction and experience with Medicaid providers and systems of care. These measures can provide DHCF with data to comprehensively assess MCO performance in the areas of quality, access, and timeliness of healthcare services.

The District's contracted MCOs are required to submit validated results of their HEDIS and CAHPS measures to DHCF and Delmarva. To avoid duplicative efforts, Delmarva does not re-validate these

¹⁰ HEDIS® is a registered trademark of the National Committee for Quality Assurance (NCQA).

¹¹ CAHPS® is a registered trademark of the Agency for Healthcare Research and Quality (AHRQ).

measures, but does review the audit findings and uses MCOs' reported rates for the HEDIS and CAHPS measures in its analysis of MCO performance. Of note, MCO A submitted unvalidated data for HEDIS and did not conduct a CAHPS survey for CY 2012 as it was in the process of being acquired by a new MCO. Therefore, the accuracy and reliability of the reported rates for MCO A cannot be assured.

The full set of reported HEDIS and CAHPS rates can be found in Appendix 3 and 4.

Aggregation and Analysis of Results

Findings from the mandatory activities outlined in the EQRO contract as well as the MCOs' HEDIS and CAHPS measures are aggregated and analyzed by Delmarva to provide an evaluation of the MCOs' performance. Standards and/or measures from each activity are allocated to domains indicative of quality, access, or timeliness of care and services. Separate report sections address each specific domain and describe the methodology and data sources used to draw conclusions. The final report section summarizes findings and recommendations to DHCF and the health plans to further improve the quality of, access to, and timeliness of health services for Medicaid members.

Section II - Quality

Introduction

Quality, as it pertains to external quality review, is defined as “the degree to which a Managed Care Organization (MCO) or Prepaid Inpatient Health Plan (PIHP) increases the likelihood of desired health outcomes for its enrollees (as defined in 42 CFR 438.320[2]) through its structural and operational characteristics and through the provision of health services that are consistent with current professional knowledge.” (Centers for Medicare & Medicaid Services [CMS], *Final Rule: Medicaid Managed Care; 42 CFR Part 400, et. al. Subpart D - Quality Assessment and Performance Improvement*, [June 2002]).

Purpose and Methodology

This assessment of quality encompasses health outcomes as well as the processes of care delivery (e.g., operational systems) and the experience of receiving care to assess how well the MCOs are performing in improving health outcomes for members. In evaluating quality, Delmarva assessed whether DHCF achieved its Strategic Plan goals pertinent to the managed care program. In addition, Delmarva conducted an analysis of the MCOs’ progress in resolving operational issues that were identified as opportunities for improvement from the prior year’s structure and operational systems compliance review activities, evaluated the processes MCOs used to calculate performance measures for the PIP indicators, validated the MCOs’ processes for conducting the PIPs, and analyzed the results from the MCOs’ reported HEDIS and CAHPS rates.

Findings

Strategic Performance Plan

42 CFR Part 438.202 (a) requires that each state contracting with a MCO or PIHP must have a written strategy for assessing and improving the quality of managed care services provided by MCOs and PIHPs. DHCF established a performance plan in FY 2011 which sets forth specific quality initiatives and goals aimed at improving health outcomes for District residents. Quality initiatives focus on informing consumers and providers about the quality of services provided to Medicaid enrollees, making information about available resources more readily available to providers, and establishing goals for reducing adverse health outcomes. The findings regarding the status of the District’s performance goals can be found in Table II-1.

Table II-1. Strategic Plan Initiatives

Initiative	Description
1) Improve birth and perinatal outcomes in the Medicaid program.	CY 2012 marks the fourth and final year in a multiyear initiative to improve the health of babies born to mothers in the Medicaid program. The goal of this health care quality improvement collaboration is to reduce the rate of adverse outcomes per 1,000 pregnancies and infants by reducing the following adverse events: newborns with birth weight less than 2,500 grams;

Initiative	Description
	newborns of 32 weeks or less gestational age; pregnant women not tested for HIV prior to giving birth; pregnancies ending in miscarriage or fetal loss (early or late); and deaths of infants in the first year of life.
2) Launch a resource website for case managers and perinatal providers.	As part of the collaborative to reduce adverse birth outcomes, DHCF will launch a resource website for health plan case managers and other medical care providers. Resources will include information on services to meet psychosocial risk factors (such as alcohol or other substance misuse, domestic violence, and mental health problems), as well as services to support healthy babies, such as breast feeding. The site will clearly make the connection between psychosocial needs and health, and link case managers to services that are available to the mother. The services will include those based in the District, services available from national organizations, and services through virtual communities on the web.
3) Reduce adverse outcomes for people with chronic diseases.	CY 2012 marks the fourth year of this multiyear initiative to improve the health of people with serious chronic illnesses. The goal of this collaborative is to reduce the rates of emergency room visits and hospital admissions for individuals with asthma, diabetes, high blood pressure, and congestive heart failure. Performance is calculated and reported annually, as the number of adverse chronic disease outcomes per 1,000 individuals with asthma, high blood pressure, diabetes and congestive heart failure. DHCF expects to see significant reductions in the rates of emergency department and acute hospital admissions among the targeted population as a result of this collaborative.
4) Produce a consumer report card to facilitate beneficiary choice in managed care.	In FY 2009, DHCF developed a managed care report card, with reporting requirements for Medicaid managed care plans beginning in FY 2010. Foremost, the report card is intended to be a tool that adult Medicaid and Alliance beneficiaries and parents or guardians of children can use to help choose a managed care organization (MCO). The report card will work in concert with DHCF's other quality improvement, pay-for-performance, and managed care initiatives. Data on the report card will include information on: patient satisfaction; access to specialist doctors; how well patient care is managed; customer service; how well each plan met national quality standards; and how often each plan meets quality standards for specific health conditions.

An evaluation of DHCF's status in meeting its quality goals found that:

- Goal 1: Although one MCO submitted unvalidated data, all MCOs met the goal to decrease adverse perinatal and birth outcomes to <210 adverse events per 1,000 members for MY 2012.
- Goal 2: DHCF's goal to launch a perinatal resources website was partially met for MY 2012. Although the website was in development, the actual launch of the website did not occur until Spring 2013. The website can be found at: <http://dhcf.dc.gov/page/pregnancy-resources>
- Goal 3: The goal to decrease adverse outcomes of chronic diseases to <450 per 1,000 members was not met for MY 2012 by any of the individual MCOs. In the upcoming year, DHCF and the collaborative work group have opted to focus efforts on decreasing emergency department and acute inpatient hospital admissions related to asthma.
- Goal 4: DHCF issued a request for proposals (RFP) to solicit new MCOs for FY 2013. Therefore, the goal to produce a consumer report card is deferred to FY 2015 when it is expected that data from the new MCOs will be available to produce a report card.

Structure and Operational Systems Review

Quality Assessment and Performance Improvement (QAPI) - 42 CFR § 438 Subpart D, Quality Assessment and Performance Improvement, sets forth MCO specifications for quality strategies to ensure the delivery of high quality health care and customer service. Several operational standards related to quality were evaluated and reported for the CY 2011 Annual Technical Report, including review of the Quality Improvement (QI) Program, Annual QI Review, QI Work Plan, QI Committee structure, Performance Improvement Projects (PIPs), other related documentation such as meeting minutes, and evidence of evaluation, analysis and follow-up on findings.

DHCF mandates that MCOs must achieve full compliance with all standards and must submit action plans to address any areas that are not found fully compliant or for which opportunities for improvement have been identified. Delmarva focused activities on providing MCOs with technical assistance in the development of action plans and monitoring MCOs' progress in resolving areas of concern identified in the CY 2011 report.

There were no structure or operational systems findings related to the MCOs' quality programs in the prior year, therefore, no action plans were required in this area.

Performance Measures Validation

Given that the health plans are required to submit audited HEDIS/CAHPS rates, the District chose to direct EQRO activities to auditing and validating the MCOs' information systems and processes for collecting data and reporting collaborative PIP measurement results as these are not validated as a component of the MCOs' NCQA audit activities. Delmarva conducted validation activities for MCO B and MCO C. MCO A did not participate in validation activities as it was preparing to exit the Medicaid market. Therefore, Delmarva cannot attest to the accuracy and reliability of rates submitted by MCO A.

The goal of conducting the performance measures validation activity is to evaluate the accuracy and reliability of the measures produced and reported by the MCOs and to determine the extent to which the MCOs followed specifications established by DHCF for calculating and reporting the collaborative measures rates. The accuracy and reliability of the reported rates is essential to ascertaining whether the MCOs' quality improvement efforts have resulted in improved health outcomes.

Three key validation activities are conducted:

- 1) Review of data systems and processes used by the MCO to construct the measure rates;
- 2) Assessment of the calculated rates for algorithmic compliance to defined specifications; and
- 3) Verification that the reported rates are based on accurate sources of information.

Information from several other sources is also used to satisfy validation requirements. These sources include, but are not limited to the MCOs’:

- Information Systems Capabilities Assessment (ISCA);
- Claims systems and processes (including lab, dental, and pharmacy data);
- Data warehouse overview;
- Documentation (e.g., IS specifications, data dictionaries, program source code, data queries, record review tools, policies and procedures) for review prior to or during the onsite validation;
- Observations resulting from onsite information system queries and MCO staff interviews;
- Source code review; and
- Information provided subsequent to the onsite visit to address any deficiencies and/or outstanding issues.

The ISCA tool was reviewed and used to assess the MCOs on factors essential in the performance measure process, including data integration, data control, and calculation of rates. Based on the information provided, the MCOs have a satisfactory process for data integration, appropriate data control, and adequate interpretation of measures specifications.

Source code was reviewed which included an assessment and validation of the diagnosis, procedure, pharmacy, and revenue codes to ensure these codes were correctly applied. Additionally, the source code review determined that members of the denominators were correctly selected from the populations, time parameters were accurate and numerators included appropriate parameters and members.

Table II-2 provides the MCOs’ validation of systems and processes for constructing the Adverse Perinatal and Birth Outcomes measures and Adverse Outcomes of Chronic Diseases measures. MCO A did not participate in validation activities. Therefore, Delmarva cannot attest to the validity of the processes used by MCO A to calculate the performance measures.

Table II-2. Audit Designation Table for Adverse Perinatal and Birth Outcomes and Adverse Outcomes of Chronic Diseases

Performance Measure: Adverse Perinatal Outcomes and Adverse Outcomes of Chronic Diseases				
Validation Component	Audit Element	Validation Results		
		MCO A*	MCO B	MCO C
Documentation	Data integration and control procedures are assessed to determine whether the MCO has the appropriate processes and documentation in place to extract, link, and manipulate data for accurate and reliable measure rate construction. Measurement procedures and programming specifications including data sources, programming logic, and computer source codes are documented.	Not Met	Met	Met

Performance Measure: Adverse Perinatal Outcomes and Adverse Outcomes of Chronic Diseases				
Validation Component	Audit Element	Validation Results		
		MCO A*	MCO B	MCO C
Denominator	Validation of the denominator calculations for the performance measures is conducted to assess the extent to which the MCO used appropriate and complete data to identify the entire population and to the degree to which the MCO followed the measures specifications for calculating the denominator.	Not Met	Met	Met
Numerator	The validation of the numerator determines if the MCO correctly identified and evaluated all qualifying medical events for appropriate inclusion or exclusion in the numerator for each measure and followed the measure specifications for calculation of the numerator.	Not Met	Met	Met
Reporting	Validation of reporting assesses whether the MCOs followed the District's requirements for reporting the measures rates and followed specifications. The District requires the MCOs to report the denominator, specific numerator events, and calculated final rates. A final determination is made as to whether the MCO is fully compliant (FC), substantially compliant (SC), or non-compliant (NC).	NC	FC	FC

*MCO A did not participate in validation activities. Therefore, Delmarva cannot attest to the validity of the processes used by MCO A to calculate the performance measures.

In conducting the validation activities for the Adverse Perinatal and Birth Outcomes measures, auditors concluded that:

- MCO A did not undergo validation activities and therefore MCO A's processes and systems for constructing the measures must be deemed "Non Compliant." Since the MCO did not participate in validation activities, Delmarva cannot attest to the accuracy or reliability of the reported rates.
- MCO B and MCO C used valid and reliable methods for calculating performance measures.

Performance Improvement Projects

Each MCO is required to annually conduct PIPs that are designed to achieve, through ongoing measurements and interventions, significant improvement in clinical or non-clinical care areas that are expected to have a favorable effect on health outcomes. The MCOs' PIPs must include measurements of performance using objective quality indicators, the implementation of system interventions to achieve improvement in quality, evaluation of the effectiveness of the interventions, and planning and initiation of activities for increasing or sustaining improvement. The validation activity is performed to assess whether the MCOs' PIPs are designed, conducted, and reported in a sound manner, and the degree of confidence DHCF can have in the reported results.

DHCF made some key decisions at the outset of these initiatives. First, they decided to measure progress for the three participating plans as a whole rather than to compare and contrast their performance. The intent was to establish a baseline for 2008 and then gauge progress of the managed care effort as a whole to drive improvement on a population rather than health plan basis. All plans are required to participate, but they are not competitively scored on these initiatives.

The collaborative stakeholders meet on a monthly basis. Both collaborative work groups have sought community participation to solicit input from providers and consumers and to expand their influence beyond the formal membership. Each plan documents its individual progress as a component of its PIP reporting.

Improving Perinatal and Birth Outcomes

Prenatal care is one of the most effective interventions for improving birth outcomes. Regular prenatal care, early and on-going throughout pregnancy, is a key factor in preventing prematurity and low birth weight. By using early risk assessment tools, providers can improve and sometimes prevent costly outcomes. The cost of care for premature and low birth weight infants not only puts a strain on current budgets, but the costs associated with long-term care as well for children born with developmental delays.

DHCF, in collaboration with the District's three Medicaid MCOs and other stakeholders, embarked on a multiyear initiative to improve perinatal birth outcomes for District residents. Adverse events are defined as:

- Miscarriage or fetal loss;
- Neonates weighing <2500 grams;
- Neonates with a gestational age <32 weeks;
- Pregnancies for which the outcome is unknown;
- Lack of maternal HIV testing; and
- Death of an infant age 0-365 days.

The goal of the collaborative is to reduce the rate of adverse perinatal events that occur for pregnancies in the measurement year, as well as among infants, ages 0-365 days, in the same measurement year. Data from CY 2008 were used to calculate the baseline rate and MY 2012 represents the fourth and final re-measurement period for the collaborative. A description of the PIP and associated measures specifications can be found in Appendix 1.

Table II-3 provides findings for each MCO against the 10 validation steps for the Adverse Perinatal and Birth Outcomes PIP.

Table II-3. Perinatal PIP Validation Results

Step	Description	Review Determinations		
		MCO A	MCO B	MCO C
1	Assess the Study Topic	Met	Met	Met
2	Review the Study Question(s)	Met	Met	Partially Met
3	Review the Selected Study Indicator(s)	Partially Met	Met	Met
4	Review the Identified Study Population	Met	Met	Met
5	Review Sampling Methods	NA*	NA*	NA*
6	Review Data Collection Procedures	Met	Met	Met
7	Assess Improvement Strategies	Met	Met	Met
8	Review Data Analysis & Interpretation of Study Results	Partially Met	Met	Partially Met
9	Assess Whether Improvement is Real Improvement	Partially Met	Met	Met
10	Assess Sustained Improvement	Partially Met	Partially Met	Partially Met

*NA denotes that no sampling was required. The entire eligible population was assessed.

Each MCO's perinatal PIP was reviewed against all components contained within the 10 step review process to assess the validity of the MCOs' PIP processes. Findings are as follows:

- Step 1: The study topic was selected by DHCF as a joint topic for all MCOs. It addresses key aspects of care and services relevant to the population served by the MCOs.
- Step 2: The study question was deemed partially met for MCO C because the MCO addressed the overall project aim but did not develop a clear and measureable study question.
- Step 3: Study indicators were deemed partially met for MCO A because the MCO did not follow through on the recommendations made in the previous year to include specific adverse event (outcome) indicators in line with collaborative requirements and to facilitate comparison of MCO project results.
- Step 4: All MCOs conducted analysis of the study population to identify barriers.
- Step 5: Sampling methods are not applicable for the perinatal study as the entire eligible population was assessed and MCOs were not required to conduct sampling.
- Step 6: All MCOs used administrative data to study the population and to construct the measures.
- Step 7: All MCOs conducted on-going analysis of the effectiveness of interventions.
- Step 8: Data analysis and interpretation of results, was deemed partially met for MCO A because the project analysis did not adequately address or analyze performance against previous rates for the indicators. MCO C did not report all numerical results accurately in its analysis.
- Step 9: MCO A could not document any quantitative improvement in the indicators.
- Step 10: None of the MCOs were able to sustain improvement over baseline rates in all indicators.

In addition to the validation activity, Delmarva conducted analysis and trending of reported indicators from baseline to MY 2012 utilizing MCO reported rates. The MCO weighted average for adverse events improved from the baseline 2008 rate of 328 (32.83%) adverse events per 1,000 pregnancies and births to 180 (17.99%) adverse outcomes per 1,000 in MY 2012.

- The number of pregnant women served by the MCOs with pregnancies ending in each measurement year increased from 4,419 (baseline) to 6,124 (MY 2012).
- In baseline year 2008 the rate of pregnancies resulting in low birth weight babies was 1.3%. By MY 2012 the rate increased to 5.4%.
- Preterm births increased from baseline .36% to a MY 2012 rate of 3.7%.
- The rate of HIV testing improved substantially over the course of the collaborative. Lack of maternal HIV testing has been the largest contributor to the adverse perinatal health outcomes rates since initiation of the PIP. In spite of growth in the perinatal denominator population, this was the area most impacted by the MCOs' PIP efforts. In 2008, lack of HIV testing was noted in approximately 82% of the eligible population. In 2012, the rate decreased to approximately 30% of the eligible population. Improvement in the HIV testing rate contributed significantly to the overall reduction in adverse perinatal outcomes District-wide over the course of the collaborative.

Trended rates for adverse perinatal outcomes can be found in Table II-4. Although PIP processes were evaluated for MCO A, MCO A did not participate in validation activities to ascertain the reliability of its reported rates for MY 2012.

Table II-4. Trended Rates for Adverse Perinatal Outcomes

Measurement Year	Adverse Perinatal Outcomes			
	MCO A*	MCO B	MCO C	DC Weighted Average
Baseline: MY 2008	50.10%	22.22%	6.64%	32.83%
	501	222	66	328
Re-measurement 1: MY 2009	29.22%	36.97%	10.32%	23.14%
	292	370	103	231
Re-measurement 2: MY 2010	25.64%	25.15%	17.39%	23.15%
	256	251	174	232
Re-measurement 3: MY 2011	13.46%	35.84%	20.62%	15.30%
	135	358	206	153
Re-measurement 4: MY 2012	18.91%	33.00%	13.71%	17.99%
	189	330	137	180

Comparison of rates between MCOs is not advised as no population risk adjustment has been conducted.

*MCO A did not undergo validation activities to confirm rates for MY 2012. Therefore, Delmarva cannot attest to the accuracy of the reported rate for MY 2012.

MCOs implemented a variety of interventions over the course of the collaborative projects aimed chiefly at early identification of pregnant women and education of providers and members:

- Perinatal Risk Assessment Form - In year one of the collaborative, all MCOs agreed upon and implemented a standardized perinatal risk assessment form to be completed at the time of the first prenatal visit.
 - Tied provider payment to the completion of the form and initiated provider incentives for timely completion and submission of the form.
- Case Management - MCOs used a variety of case management processes including face-to-face contact with members who are hard to reach using case managers, social workers, and patient navigators.
 - Outsourced case management of high-risk members to an organization specializing in this type of intense case management.
 - Extended outreach staff hours to provide increased case management services during hours when members might be more easily contacted.
 - Developed a multi-disciplinary team of behavioral health specialists, case managers, and social workers to focus efforts on members with co-existing mental health issues or classified as high risk.
 - Utilized co-management of pregnant members by an OB case manager and the members pre-pregnancy case manager.
- Member and Provider Education – All MCOs focused on increased education of provider and members in the following areas.
 - Member pre-conception and inter-conception counseling and education.
 - Provider education specific to completion of the perinatal risk form.
 - Provider education on guidelines associated with perinatal HIV testing.
 - Member education through community “baby shower” events.
- Data Analysis – MCOs used a variety of data analytic techniques in an effort to identify pregnant and high risk members earlier in the pregnancy.
 - Increased the frequency of obtaining and analyzing laboratory data from monthly to weekly.
 - Received weekly census reports from its largest participating OB provider.
 - Utilized automated technologies to target hard to reach members.
 - Identified members with co-occurring mental health or learning disabilities for intensive case management.

Adverse Outcomes of Chronic Diseases

DHCF, recognizing the impact of chronic illnesses on both costs to the Medicaid program and health outcomes for the District’s Medicaid residents, embarked on a multi-year collaborative effort to reduce adverse health outcomes of chronic diseases for Medicaid members enrolled in MCOs. The PIP focuses on measuring changes in the health outcomes of individuals with asthma, diabetes, hypertension, and congestive heart failure to improve the health of people in the DC Medicaid and Alliance programs enrolled in MCOs. A description of the PIP and associated measures specifications can be found in Appendix 2.

The adverse outcomes of chronic diseases indicator measures the rate of occurrence of emergency room visits and hospitalizations for Medicaid and Alliance managed care plan enrollees with any one, or combination, of the diagnoses of asthma, diabetes, hypertension, or congestive heart failure. This proxy measure for adverse outcomes is founded in the belief that people with chronic illnesses who are well managed and have an ongoing source of medical care will have fewer emergency department visits or hospitalizations which may indicate poor control or complications secondary to the chronic disease.

Each MCO's chronic diseases PIP was reviewed against all components contained within the 10 step review process used to evaluate the validity of the MCOs' PIP activities.

- Step 1: The study topic was selected by DHCF as a joint topic for all MCOs. It addresses key aspects of care and services relevant to the population served by the MCOs.
- Step 2: All MCOs developed clear and measureable study questions.
- Step 3: All MCOs addressed the individual study indicators by disease type.
- Step 4: All MCOs conducted analysis of the study population to identify barriers.
- Step 5: Sampling methods are not applicable for the perinatal study as the entire eligible population was assessed and MCOs were not required to conduct sampling.
- Step 6: MCO A submitted unvalidated data. Data collection methods appear to deviate from the methodology used in prior years.
- Step 7: All MCOs conducted on-going analysis of the effectiveness of interventions.
- Step 8: Data analysis and interpretation of results, was deemed partially met for MCO A and MCO C because the project analysis did not adequately address or analyze performance against previous rates for the indicators.
- Step 9: All MCOs were able to document improvement in the death rate indicator but none could document improvement in the overall adverse event rates.
- Step 10: MCO A and MCO B were unable to sustain improvement over baseline rates in all indicators. MCO C was able to document sustained improvement in the death rate indicator but not in any other project indicators or the overall adverse event rate.

Validation results for the Adverse Outcomes of Chronic Diseases PIP can be found in Table II-5.

Table II-5. Chronic Diseases PIP Validation Results

Step	Description	Review Determinations		
		MCO A	MCO B	MCO C
1	Assess the Study Topic	Met	Met	Met
2	Review the Study Question(s)	Met	Met	Met
3	Review the Selected Study Indicator(s)	Met	Met	Met
4	Review the Identified Study Population	Met	Met	Met

Step	Description	Review Determinations		
		MCO A	MCO B	MCO C
5	Review Sampling Methods	NA*	NA*	NA*
6	Review Data Collection Procedures	Partially Met	Met	Met
7	Assess Improvement Strategies	Met	Met	Met
8	Review Data Analysis & Interpretation of Study Results	Partially Met	Met	Partially Met
9	Assess Whether Improvement is Real Improvement	Partially Met	Partially Met	Partially Met
10	Assess Sustained Improvement	Not Met	Not Met	Partially Met

*NA denotes that no sampling was required. The entire eligible population was assessed.

In addition to the PIP validation activities, Delmarva conducted analysis and trending of reported adverse event rates from baseline to MY 2012. The collaborative goal for adverse events related to chronic diseases was set at <450 per 1,000 members. None of the MCOs were able to individually achieve this goal. An aggregated District rate was not calculated because data submitted by MCO A was not validated. The methodology used by MCO A to calculate the MY 2012 rate appears to be substantially changed from prior years. The overall rates of adverse events for members with chronic diseases fluctuated from 7-14 percentage points each year.

Table II-6 provides trended rates for adverse outcomes of chronic diseases over the course of the collaborative.

Table II-6. Trended Rates for Adverse Outcomes of Chronic Diseases

Measurement Year	Adverse Outcomes of Chronic Diseases			
	MCO A*	MCO B	MCO C	DC Weighted Average
Baseline: MY 2008	30.22%	67.95%	56.27%	34.26%
	302	679	563	343
Re-measurement 1: MY 2009	40.47%	81.70%	86.82%	48.98%
	405	817	868	490
Re-measurement 2: MY 2010	27.42%	58.06%	68.65%	38.84%
	274	581	687	388
Re-measurement 3: MY 2011	34.95%	89.91%	72.11%	45.84%
	350	899	721	458
Re-measurement 4: MY 2012	188.33%	97.71%	81.84%	NA*
	1883	977	818	NA*

Comparison of rates between MCOs is not advised as no population risk adjustment has been conducted.

*MCO A did not undergo validation activities to confirm rates for MY 2012. Therefore, Delmarva cannot attest to the accuracy of the reported rate for MY 2012.

*NA denotes that a District weighted average was not calculated because MCO A data was not validated.

An analysis of the PIP results found that:

- High emergency department utilization for members with asthma, without a corresponding high rate of hospitalizations, indicates that there is the potential to decrease emergency department visits by focusing on medication compliance, coordination of care, and better access to ongoing primary care physicians for these members.
- Of those members diagnosed with a chronic illness, those with hypertension had the highest rate for hospitalizations and were second to asthmatics for emergency department visits.

MCOs implemented a variety of interventions over the course of the collaborative projects aimed chiefly at education of providers and members:

- Offered incentives for routine and preventative care visits.
- Dedicated case managers to follow-up on members who utilized the nurse triage line.
- Targeted face-to-face education of providers regarding hypertension guidelines.
- Used pharmaceutical programs to remind members when refills were due.
- Sent case listings of members identified with a chronic illness to PCPs.
- Sent notices to PCPs of all members utilizing emergency department services 3 or more times in a 6 month period.
- Offered transportation to all members receiving case management services for medical appointments.
- Used “Health Navigators” to provide face-to-face contact with hard to reach members.

HEDIS

As previously noted, all District Medicaid MCOs are required to calculate and submit audited HEDIS and CAHPS measures to DHCF. Delmarva selected and analyzed results from HEDIS effectiveness of care measures and CAHPS measures reported by the MCOs to assess quality. The full set of HEDIS and CAHPS measures and corresponding MCO rates can be found in Appendix 3.

Managing chronic disease is a complex matter requiring care coordination between the health plan and the servicing providers. Research has shown that following evidence-based health care guidelines for treatment and monitoring of these individuals can improve health status. HEDIS measures provide information on the health status of the MCOs’ chronic diseases populations and can be used in conjunction with the MCOs’ chronic diseases adverse event rates to assess how well the MCOs are performing in improving health status for those living with a chronic illness.

Comprehensive Diabetes Care

In 2008, diabetes ranked as the sixth leading cause of death in the District of Columbia. According to 2010 estimates by the CDC, nearly 25.8 million people in the United States have diabetes. 8.3% of the District’s residents reported having been diagnosed with diabetes.¹² Diabetes can lead to significant health

¹² Diabetes in the District of Columbia, District of Columbia Department of Health, Diabetes Prevention and Control Program. Available at: <http://www.doh.dc.gov/sites/default/files/dc/sites/doh/Diabetes>.

complications such as heart disease, kidney disease, blindness and amputations. Controlling levels of blood glucose, blood pressure, and cholesterol are key to preventing diabetes related complications.

Table II-7 provides MCO and District weighted averages for the comprehensive diabetes care measures.

Table II-7. HEDIS Comprehensive Diabetes Care

HEDIS Measure	MCO A		MCO B		MCO C		DC Weighted Average		National HEDIS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Comprehensive Diabetes Care - Blood Pressure Control (<140/90) - % members 18–85 years of age with HTN whose BP was adequately controlled	40.12	NR	38.71	43.90	48.72	50.91	43.17	18.73	58.76
Comprehensive Diabetes Care - Eye Exams - % of members who had a retinal eye exam	53.74	44.51	48.39	43.90	52.37	53.47	53.22	47.75	53.24
Comprehensive Diabetes Care - HbA1c Testing - % members 18–75 years of age with Hemoglobin A1c (HbA1c) testing	76.97	78.98	70.97	73.17	78.10	79.20	77.33	79.03	82.91
Comprehensive Diabetes Care - HbA1c Control <7%y	31.32	32.27	NA	20.00	26.50	31.49	29.60	31.88	34.03
Comprehensive Diabetes Care - HbA1c Control <8%	44.72	45.36	35.48	21.95	40.15	44.71	43.04	44.98	46.45
Comprehensive Diabetes Care - Poor HbA1c Control >9% (lower rate is better)	47.22	46.30	61.29	73.17	53.10	45.99	49.40	46.39	44.82
Comprehensive Diabetes Care - LDL-C Screening - % of members who were screened for low density lipoproteins	71.98	74.00	54.84	58.54	74.45	73.91	72.75	73.85	75.43
Comprehensive Diabetes Care - LDL-C Control (LDL-C<100 mg/dL) - % of members whose LDL is within the recommended range	21.50	35.60	29.03	17.07	29.01	33.76	24.22	34.81	33.85
Comprehensive Diabetes Care - Medical Attention for Nephropathy (Kidney Disease)	81.38	77.39	38.71	43.90	83.03	82.48	81.70	79.00	78.35

*NA denotes that the MCO did not have a large enough population to report on this measure.

*NR denotes that the MCO chose not to report on this measure.

The District's MCO weighted averages for MY 2012 improved over 2011 rates in 6 of the 9 comprehensive diabetes care indicators but lagged behind the National Medicaid average in all but two indicators, LDL-C control and medical attention for nephropathy.

Controlling High Blood Pressure

According to CDC statistics approximately 1 in 3 adults in the United States has hypertension and less than 46% of people with hypertension have their blood pressure under control (<140/90). Costs associated with hypertension are estimated to be nearly \$131 billion annually for the nation.¹³ Lifestyle modifications such as increased exercise and reduced salt intake can help individuals control their blood pressure. In addition, antihypertensive pharmacotherapy is effective in controlling blood pressure and has been associated with reduced incidence of stroke, heart attack, heart failure, and kidney disease.

Table II-8 provides the MCOs' and District weighted averages for 2011 and 2012 for controlling high blood pressure.

Table II-8. HEDIS Controlling High Blood Pressure

HEDIS Measure	MCO A		MCO B		MCO C		DC Weighted Average		National HEDIS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
High Blood Pressure	28.95	NR	NA	58.33	42.34	44.77	33.58	44.94	56.11

*NA denotes that the MCO did not have a large enough population to report on this measure.

*NR denotes that the MCO chose not to report on this measure.

The District weighted average for controlling high blood pressure did not meet the National Medicaid average for MY 2012.

- Of note, one MCO that did not have a large enough population of members with hypertension in MY 2011 to report on this measure was able to report for MY 2012.
- MCO A, comprised of approximately 2/3 of the District's Medicaid enrollees, chose not to report on this measure.

Use of Appropriate Medication for People with Asthma

According to the CDC approximately 1 in 12 adults and 1 in 10 children in the United States had asthma in 2009. It is one of the most common chronic diseases in childhood and accounts for about \$50 billion in

¹³ "High Blood Pressure Facts". Centers for Disease Control and Prevention. Available at: www.cdc.gov/bloodpressure/facts.htm

associated medical costs annually. The overall prevalence of asthma in the District is estimated to be 18.0%.¹⁴ Asthma is a chronic lung disease that can be life-threatening if not properly managed. However, research has shown that the use of evidence-based guidelines can significantly improve management of the disease. These guidelines recommend specific pharmacotherapy aimed at controlling asthma exacerbations in the long term as well as medications for quick relief of acute asthma symptoms.

The HEDIS indicator, use of appropriate medications for people with asthma, measures how well providers are adhering to these treatment guidelines. The HEDIS measure for medication management for people with asthma provides an indication of how compliant asthmatics are with use of prescribed asthma control medications. MY 2012 represents the first year for this new measure.

The MCOs' and the District's weighted averages for 2011 and 2012 are found in Table II-9.

Table II-9. HEDIS Appropriate Medications for People with Asthma

HEDIS Measure	MCO A		MCO B		MCO C		DC Weighted Average		National HEDIS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Use of Appropriate Medications for People with Asthma - Total	86.37	81.38	88.59	88.93	80.63	79.74	85.77	81.68	83.77
Medication Management for People with Asthma – Medication Compliance 50% (Total)	50.98	48.53	56.36	50.23	50.49	49.40	51.51	48.88	NB
Medication Management for People with Asthma – Medication Compliance 75% (Total)	27.39	24.17	40.61	30.88	26.96	27.22	28.79	25.48	29.00

*NB denotes that there are no national benchmarks available for the measurement year.

14 "Asthma Fact Sheet", American Lung Association. Available at: www.lung.org/lung-disease/asthma/resources/facts-and-figures/asthma-children-fact-sheet.html.

Key findings related to asthma care include:

- The District's weighted average for appropriate medications for people with asthma fell below the national Medicaid average, dropping close to 4 percentage points from MY 2011.
- MCO B exceeded the national Medicaid average for MY 2012 and improved slightly over its MY 2011 rate for appropriate medications for people with asthma.
- MCO A and C fell below the national Medicaid average and declined in performance from their MY 2011 rates for appropriate medications for people with asthma.
- MCO B exceeded the National Medicaid average for 75% compliance with medications for people with asthma.

CAHPS

Adult enrollees and parents/guardians of child enrollees are asked annually to rate the quality of care and services provided by MCOs in which they are enrolled. MCOs are required to assess consumer satisfaction using a standardized instrument, the Consumer Assessment of Healthcare Providers and Systems (CAHPS).

The CAHPS survey questionnaire was updated from version 4.0H to version 5.0H for MY 2012. The revisions included changes to ordering and wording of survey questions and specification changes for some measures including *Shared Decision Making* and *Health Promotion and Education*. The specification changes were significant enough that NCQA did not publicly report benchmarks for these measures for MY 2012.

MCO A did not conduct an adult or child survey for MY 2012. As this MCO represented nearly two-thirds of the District's managed care population, a weighted average was not calculated for MY 2012. MCO B did not conduct an adult CAHPS survey in MY 2011 because its adult population was too small. MY 2012 is the first year that MCO B had a large enough adult population to field the survey.

Tables II-10 and II-11 provide results from the adult and child CAHPS surveys for MY 2011 and 2012 on measures representative of quality.

Table II-10. Adults CAHPS (Experience with Care) Representative of Quality

Adult CAHPS	MCO A		MCO B		MCO C		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
How Well Doctors Communicate	91.90	NR	NA	92.00	88.04	92.81	89.27
Customer Service	82.10	NR	NA	85.00	73.87	80.26	86.16
Shared Decision Making	64.40	NR	NA	71.00	55.74	51.56	NB

Adult CAHPS	MCO A		MCO B		MCO C		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Health Promotion and Education	65.10	NR	NA	74.00	62.46	79.45	NB
Coordination of Care	78.30	NR	NA	81.00	69.44	76.19	78.66
Rating of Health Care (% of members rating health care 8,9, or 10 on a scale of 1-10)	68.00	NR	NA	74.00	67.05	73.31	70.84
Rating of Personal Doctor (% of members rating personal doctor 8,9, or 10 on a scale of 1-10)	83.30	NR	NA	84.00	81.08	82.52	78.36
Rating of Specialist (% of members rating specialist seen most 8,9, or 10 on a scale of 1-10)	73.50	NR	NA	78.00	71.72	69.48	79.37
Rating of Health Plan (% of members rating health plan 8,9, or 10 on a scale of 1-10)	77.10	NR	NA	78.00	68.13	70.30	73.53

*NA indicates fewer than 100 responses were available.

*NR denotes that the MCO did not submit data.

*NB denotes that there are no national benchmarks available for the measurement year.

Analysis of the adult CAHPS surveys showed that the highest satisfaction ratings for MCO B and C were in the area of how well doctors communicate.

- MCO B exceeded the national Medicaid average in 5 of the 9 measures.
- MCO B exceeded 80% satisfaction levels for 4 of the 9 measures.
- MCO C exceeded the national Medicaid average for 4 of the 9 measures.
- MCO C exceeded an 80% satisfaction level for 3 of the 9 measures.
- MCO C improved in 7 of the 9 measures over the MY 2011 rates.

Table II- 11. Child CAHPS (Experience with Care) Representative of Quality

Child CAHPS	MCO A		MCO B		MCO C		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
How Well Doctors Communicate	90.20	NR	93.00	92.00	91.10	91.56	92.61
Customer Service	81.00	NR	85.00	90.00	73.80	84.36	87.61

Child CAHPS	MCO A		MCO B		MCO C		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Shared Decision Making	67.10	NR	94.00	77.00	66.27	50.00	NB
Health Promotion and Education	68.00	NR	74.00	79.00	64.50	76.05	NB
Coordination of Care	70.60	NR	84.00	85.00	74.60	77.30	80.10
Rating of Health Care (% of members rating health care 8,9, or 10 on a scale of 1-10)	83.20	NR	84.00	84.00	83.13	83.60	83.12
Rating of Personal Doctor (% of members rating personal doctor 8,9, or 10 on a scale of 1-10)	89.30	NR	91.00	89.00	89.35	90.02	87.10
Rating of Specialist (% of members rating specialist seen most 8,9, or 10 on a scale of 1-10)	77.30	NR	80.00	86.00	NA	NA	84.52
Rating of Health Plan (% of members rating health plan 8,9, or 10 on a scale of 1-10)	79.90	NR	85.00	78.00	81.76	83.49	82.89

*NA indicates fewer than 100 responses were available.

*NR denotes that the MCO did not submit data.

*NB denotes that there are no national benchmarks available for the measurement year.

Analysis of the child CAHPS surveys showed that customer service showed the most improvement over MY 2011 rates for both MCO B and C. As with the adult surveys, the highest level of satisfaction for both MCO B and C were in the area of how well doctors communicate.

- MCO B exceeded the national Medicaid average for 5 of the 9 measures.
- MCO B achieved an 80% satisfaction rating for 6 of the 9 measures.
- MCO B declined by 7 percentage points in members' rating of health plan.
- MCO C exceeded the national Medicaid average for 3 of the 9 measures.
- MCO C achieved an 80% satisfaction rating for 5 of the 9 measures.

It is recommended that MCO B focus efforts on further assessment of member dissatisfaction and development of interventions to improve member satisfaction. MCO B may consider development of a more specific survey of members, or focus groups, to identify key areas of dissatisfaction.

Quality Conclusions

The health plans have quality systems and procedures in place to promote high quality care and have well-organized approaches to quality improvement. Policies, procedures, and operational plans presented during the previous year's compliance review were well defined and documented. Measurement, follow-up, and reporting across the organizations was evident based on discussions with staff, reports reviewed, and presentations of activities. The MCOs operate strong QAPI programs that include annual planning, participation from providers and MCO leadership, and provide for on-going assessment and quality improvement activities. There were no action plans required to address operational systems relative to quality based on the most recent compliance review.

In regards to the perinatal collaborative, the MCOs demonstrated improvement with a decrease in adverse events by 14.84 percentage points over the baseline 2008 rate. The largest contributor to improvement in the overall rate was the substantial increase in the rate of HIV testing for pregnant women. For the chronic care collaborative none of the MCOs achieved the goal of < 450 adverse events per 1,000 members. The lack of valid and reliable data from MCO A hampered the ability to thoroughly analyze PIP data.

Overall, the MCO HEDIS rates improved for diabetes and controlling high blood pressure; however, almost all HEDIS indicators for these chronic illnesses remained below the national Medicaid average. The HEDIS indicator for use of appropriate medications for people with asthma fell nearly 4 percentage points below the 2011 rate and failed to meet the national Medicaid average.

As MCO A and MCO C are no longer participating health plans in the District, recommendations are made only for MCO B. It is recommended that MCO B, as a component of its Quality Assurance and Performance Improvement Program, develop improvement efforts that focus on HEDIS/CAHPS performance and strive to meet minimum performance levels at the Medicaid national average.

Section III - Access

Introduction

An assessment of access considers the degree to which individuals are inhibited or facilitated in their ability to gain entry to and to receive care and services from the health care system. Factors influencing this ability include geographic, architectural, transportation, and financial considerations, among others. Access (or accessibility), as defined by the National Committee for Quality Assurance (NCQA), is “the extent to which a patient can obtain available services at the time they are needed. Such service refers to both telephone access and ease of scheduling an appointment, if applicable. The intent is that each organization provides and maintains appropriate access to primary care, behavioral health care, and member services.”

Access to healthcare is the foundation of good health outcomes. Factors influencing access include provider availability, geographic proximity, transportation, and policies that enhance access. Availability is the extent to which the organization provides the appropriate types and number of practitioners and providers necessary to meet the needs of its members within defined geographical areas.

Purpose and Methodology

Access depends on many factors, including availability of appointments, the patient’s ability to see a specialist, adequacy of the healthcare network, and availability of transportation and translation services. The purpose of this review is to ensure that MCO procedures do not result in barriers that might restrict Medicaid enrollees’ access to necessary medical care and services that promote optimal health outcomes. In addition, MCO policies and procedures must demonstrate that the MCO can adequately monitor access and have programs in place that enhance an enrollee’s ability to access necessary services, such as transportation and interpretive services.

Delmarva evaluates access to care and services for MCO enrollees through a review of the MCOs’ structure and operational systems, analysis of HEDIS measures of access (such as preventive care and well visits), and analysis of CAHPS survey results regarding member satisfaction with access.

Findings

Structure and Operational Systems Review

MCOs must have policies and procedures in place that promote access to care and services for enrollees. The specific operational policies examined addressed areas such as: second opinions; PCP selection/assignment; services provided by the Member Services Department; Member Education and

Outreach; access to covered services, emergency care, direct access services (such as family planning) and out of network care.

DHCF mandates that MCOs must achieve full compliance with all standards and must submit action plans to address any areas that are not found fully compliant or for which opportunities for improvement have been identified. Delmarva focused activities on providing MCOs with technical assistance in the development of action plans and monitoring MCOs' progress in resolving areas of concern identified in the CY 2011 report.

There were no structure or operational systems findings related to access in the prior year; therefore, no action plans were required in this area.

HEDIS/CAHPS Measures

Preventive health care measures provide information about how well a health plan provides services that maintain good health and prevent illness in adults and children. Children's access to health care is an important determinant of better health outcomes as well as readiness to learn. A regular source of care is vitally important in terms of providing appropriate preventive services and/or diagnosing and treating acute/chronic conditions in a timely manner. From a cost perspective, regular access to preventive services can decrease the need for emergency and specialized services.

Table III-1 provides information on the MCOs' performance on measures of access.

Table III-1. Preventive Care and Well Visits

HEDIS Measure	MCO A		MCO B		MCO C		DC Weighted Average		National HEDIS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Adults' Access to Preventive/Ambulatory Health Services (20-44)	75.45	74.46	79.57	78.70	67.40	69.21	73.07	72.93	80.18

Children and Adolescents' Access To PCP (7-11 Yrs)	92.72	93.44	96.20	96.97	89.00	90.11	92.40	92.83	89.82
Children and Adolescents' Access To PCP (12-19 Yrs)	85.53	86.28	92.39	93.38	83.63	86.37	85.93	86.92	88.28
Well-Child Visits in the first 15 Months of Life (6 or more visits) - % of members who had six or more well-child visits with a PCP during their first 15 months of life	55.47	50.84	53.06	65.45	58.15	69.58	56.01	55.69	63.60
Well-Child Visits in the 3rd, 4th, 5th, and 6th Years of Life - % of members 3-6 years who had 1 or more well-child visits with a PCP	75.41	79.24	86.62	89.26	74.35	76.53	75.49	78.90	71.93
Adolescent Well-Care Visits - % of members 12-21 who had at least 1 well-care visit with a PCP or an OB/GYN	59.61	49.99	68.37	65.45	53.28	53.66	58.86	52.24	49.58
Immunizations for Adolescents - Combination 1	81.92	80.41	84.62	82.50	80.00	84.62	81.39	81.53	67.16
Annual Dental Visit (Total-Age 2-21)	66.87	69.94	73.73	72.72	60.45	63.84	65.73	68.63	49.07

*NA denotes that the MCO did not have a large enough population to report on this measure.

In the area of adult access to preventive/ambulatory care, the District fell below the Medicaid national average for adults ages 20-44 years as well as for adults ages 45-64 years. However, in areas pertinent to children and adolescents' access to preventive/ambulatory care, the District performed well.

- The District weighted average exceeded the Medicaid average in 7 of the 12 measures pertaining to children and adolescents, and performed above the national Medicaid average for:
 - Lead screening.
 - Children and adolescents' access to PCP (25 mos. to 6 yrs.).
 - Children and adolescents' access to PCP (7-11 yrs.).
 - Well child visits (ages 3-6).
 - Adolescent well-care visits (ages 12-21).
 - Immunizations for adolescents (Combo 1).
 - Annual dental visit (ages 2-21).
- The District's weighted average fell below the national Medicaid average by a narrow margin for two measures:
 - Access to PCP (ages 12 mos. – 24 mos.).
 - Access to PCP (12-19 yrs.).

The District has made steady progress in improving access to preventive/ambulatory care for children and adolescents.

Table III-2 provides a comparison of CY 2011 and 2012 performance on the CAHPS measure related to getting needed care. This measure gauges the member's or parent/guardian's perceptions and satisfaction with access to care and services.

Table III-2. Adult and Child CAHPS Satisfaction with Access to Care

Adult and Child CAHPS	MCO A		MCO B		MCO C		DC Average		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Getting Needed Care - Adults	69.40	NR	NA	76.00	65.24	74.30	68.25	75.20	80.62
Getting Needed Care - Child	71.90	NR	74.00	83.00	66.98	81.63	72.22	82.30	84.38

*NA indicates fewer than 100 responses were available.

*NR denotes that the MCO did not submit data.

Analysis of CAHPS results related to access found that:

- Satisfaction with access to needed care for adults improved overall approximately 7 percentage points from MY 2011.

- Satisfaction with access to needed care for children rose approximately 10 percentage points overall from 2011.
- MCO B improved approximately 9 percentage points in getting needed care for children.
- MCO C improved approximately 9 percentage points in satisfaction with getting needed care for adults and nearly 14 percentage points for children.
- Adult and Child rates for getting needed care were below the National CAHPS Medicaid Average indicating an opportunity for continued improvement.

Access Conclusions

All MCOs conduct on-going analysis of the adequacy of provider networks, both for primary and specialty care. Member utilization of services and geo-access reports are used to identify providers with open networks to ensure that adequate numbers of providers are available to meet the needs of the population. Members receive information regarding providers, hours of operations, and the availability of transportation and translation services. Care coordination and disease management programs are aimed at identifying members with special needs, or those who are non-compliant with care, to provide additional assistance in accessing needed services and improving health status. There were no action plans required to address operational systems relative to access based on the most recent compliance review.

Access to preventive/ambulatory services for adults decreased slightly from MY 2011 for members ages 20-44 and ages 45-64. Both rates also fell below the National Medicaid average. Although adult access to PCPs measures declined, measures for access to preventive and well-child services have shown improvement year over year with 7 of the 12 child measures achieving or exceeding the national Medicaid averages. In concert with the adult access to PCP measure, adult satisfaction with “getting needed care” did not meet the National Medicaid average. However, member satisfaction increased by nearly 7 percentage points over MY 2011 rates. Parent/guardian satisfaction with “getting needed care” for child enrollees improved over MY 2011 by 10 percentage points.

MCO B fell below the national average for both adults and children for “getting needed care”. MCO B should further assess potential barriers to access to services by evaluating the availability of after-hours care and adequacy of provider networks. In addition, MCO education and outreach efforts should focus on the importance of preventive ambulatory care.

Section IV – Timeliness

Introduction

The Institute of Medicine (IOM) considers timeliness to be one of the six domains of healthcare quality. The IOM defines timeliness as “reducing waits and sometimes harmful delays.” Standards for timeliness are incorporated into MCO contracts and define the length of time in which an enrollee would be able to schedule or receive an appointment. Timeframes are based on the urgency of need and the presence or absence of health symptoms.

Timeliness of care can affect utilization, including both appropriate care and over- or underutilization of services and contribute to enrollee complaints and dissatisfaction. Presumably, the earlier an enrollee sees a medical professional, the sooner he or she can receive necessary healthcare services. Postponing needed care may result in adverse health outcomes and increases in hospitalization and emergency room utilization.

Timeliness can also be a marker for the adequacy and effectiveness of policies and procedures that promote health outcomes through communication and resolution of complaints and grievances so as to not disrupt or delay healthcare services.

Purpose and Methodology

In assessing timeliness, Delmarva selected operational standards from enrollee rights, quality assessment and performance improvement, and grievance systems. The enrollee rights standards pertain to information that MCOs must provide to members within specified timeframes. Quality standards include availability of appointments and timeliness of authorization decisions, while grievance system standards relate to the availability and timeliness of processes for resolving complaints, grievances, and appeals. In conjunction with the analysis of operational elements, Delmarva used findings from HEDIS and CAHPS measures to draw conclusions regarding the timeliness of services provided by MCOs.

Findings

Structure and Operational Systems

Timeliness is an important factor for evaluating MCO performance because organizations must have procedures in place to make timely decisions in order not to disrupt or delay the provision of care or services to their members. Several operational standards related to timeliness are evaluated during the compliance review process, including review of the MCOs’ credentialing and re-credentialing procedures, authorization activities, grievance and appeals procedures, and monitoring availability of providers and appointments. Access to a grievance system affords enrollees with the right to express dissatisfaction with care or services

provided by the MCO or its providers and the ability for MCOs to potentially identify issues that need to be addressed.

The following findings were noted in assessing MCOs for compliance with operational standards for CY 2011 related to timeliness of services for members:

- MCO B did not meet requirements for notifying members of changes to the provider network in a timely manner. The MCO did not provide timely notification to members when availability of after-hours services changed.
- MCO C did not meet requirements for its providers for timely access to care and services, taking into account the urgency of need for services. An evaluation of the MCO's provider surveys found that appointments for asymptomatic health assessments including adult physicals and EPSDT services were compliant only 70% of the time for appointments within 3 weeks. Appointments for routine symptomatic care were available within 10 business days 80% of the time.
- MCO A and MCO B did not mail timely notifications of denials in accordance with the District's requirements.
- MCO C did not meet timeliness requirements for resolving grievances.

All MCOs that failed to achieve 100% compliance on operational standards for CY 2011 were required to submit an action plan indicating the steps they will take to resolve the non-compliant issues. The action plans are reviewed and approved by Delmarva. Once an acceptable action plan has been approved, Delmarva requires the MCOs to submit periodic updates regarding implementation of the action plans. Any revisions to policies and procedures are reviewed as well as MCO generated reports to show evidence of compliance with the requirements. All three MCOs submitted action plans per requirements and all identified issues were resolved or the MCO had exited the District Medicaid market.

HEDIS/CAHPS Measures

Prenatal Care

The leading causes of infant mortality in the U.S. are congenital malformations, disorders related to pre-term birth and low-birth weight, and Sudden Infant Death Syndrome (SIDS). Prenatal visits in the first trimester provide an opportunity for early risk assessment, health promotion and medical, nutritional and psychosocial interventions that can promote good clinical outcomes for both mother and child. On-going prenatal care visits provide opportunities for early identification of complications that can put both mother and child at risk for poor outcomes.

Table IV-1 provides MCOs' performance on timeliness of prenatal care for pregnant women and the frequency at which women receive prenatal care visits.

Table IV-1. Timeliness and Frequency of Prenatal Care

HEDIS Measure	MCO A		MCO B		MCO C		DC Weighted Average		National HEDIS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Timeliness of Prenatal Care - % of deliveries where a prenatal care visit occurred in the first trimester or within 42 days of enrollment in the health plan	75.91	64.02	53.23	64.13	64.48	68.61	72.58	65.13	82.92
Frequency of Ongoing Prenatal Care (41-60%)	15.09	19.99	25.81	27.17	16.86	20.92	16.72	20.44	7.68
Frequency of Ongoing Prenatal Care (61-80%)	31.39	27.45	22.58	19.57	20.38	13.63	24.06	23.87	13.61
Frequency of Ongoing Prenatal Care (>= 81%)	32.36	34.37	16.13	31.52	30.57	36.25	30.44	34.78	60.53

Analysis of HEDIS measures related to timeliness of services found that:

- The District's weighted average fell short of the national Medicaid average for timeliness of prenatal care, largely due to a nearly 11 percentage point drop in timeliness for MCO A. MCO B improved in timeliness of prenatal care by nearly 11 percentage points over MY 2011 and MCO C improved by 4 percentage points over MY 2011.
- The District's weighted average for the frequency with which women obtain ongoing prenatal care (at least 81% of the recommended prenatal care visits) improved by 4 percentage points over MY 2011 but still fell substantially short of the national Medicaid average.
- Approximately 58% of pregnant women in the District received >61% of the recommended number of prenatal care visits compared to approximately 74% for the National Medicaid average.

CAHPS

CAHPS surveys query adults and parents/guardians of children regarding satisfaction with how quickly they can get needed care. Table IV-2 provides information regarding members' satisfaction with getting care quickly.

Table IV-2. Adult and Child CAHPS Satisfaction with Timeliness of Care

Adult and Child CAHPS	MCO A		MCO B		MCO C		DC Average		National CAHPS Medicaid Average
	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2011 %	MY 2012 %	MY 2012 %
Getting Care Quickly - Adults	70.80	NR	NA	79.00	72.29	74.00	72.67	76.50	81.16
Getting Care Quickly - Child	81.20	NR	88.00	91.00	76.43	82.90	81.51	87.00	89.18

*NA indicates fewer than 100 responses were available.

*NR denotes that the MCO did not submit data.

Adults' satisfaction with getting care quickly improved by approximately 4 percentage points from the MY 2011 rate, while satisfaction with getting care quickly for children rose approximately 5 ½ percentage points from MY 2011 to MY 2012.

- The District averages for getting care quickly for both adults and children were below their respective National CAHPS Medicaid averages indicating further opportunities for improvement.

Timeliness Conclusions

All MCOs monitor authorization decisions for timeliness. Turn-around time is measured and documented with results summarized and reported to the designated Quality Improvement and Utilization Management committees. The health plans were able to demonstrate that there were policies and procedures in place to address the major requirements for timeliness. Timeliness standards for availability of appointments were documented in the relevant procedures and are monitored through surveys.

All MCOs submitted action plans to address any areas of non-compliance from the prior year's operational systems reviews. Action plans were reviewed and approved by Delmarva, implemented by the MCOs, and on-going monitoring was conducted by Delmarva to ensure that all identified issues were resolved.

HEDIS measures for timeliness of prenatal care and the frequency with which pregnant women accessed on-going prenatal care fell short of the National Medicaid averages, declining over MY 2011 rates. CAHPS results for satisfaction with getting care quickly improved approximately four percentage points for adults, while satisfaction with getting care quickly rose approximately 5 ½ percentage points for children.

Section V – Summary of Findings

Quality

The MCOs operate strong QAPI programs that include annual planning, participation from providers and MCO leadership, and provide for on-going assessment and quality improvement activities. The MCOs operate robust care management and disease management programs to improve access to services for members who have experienced a critical event or diagnosis that requires the extensive use of resources and who need help navigating the system to facilitate appropriate delivery of care and services, as well as to bring non-compliant members into care. MCOs met all operational standards relative to quality for CY 2011; therefore, action plans were not required based on the prior year's findings.

Health outcomes remained below national Medicaid averages for District residents with chronic illnesses. However, MCOs improved in nearly all HEDIS measures for comprehensive diabetes care. Although the perinatal collaborative PIP met established goals for MY 2012, there remains much room for improvement especially in decreasing the rates of preterm infants and low birth weight babies.

MCOs improved in nearly all measures of satisfaction for child enrollees with 5 of the 9 indicators nearly exceeding an 80% satisfaction level. CAHPS results show satisfaction among adult enrollees exceeded 80% in 3 of the 9 measures, but improved over MY 2011 rates for 7 of the 9 measures. Both adult and child satisfaction with how well doctors communicate exceeded 90%.

Access

An evaluation of the MCOs' operational systems relative to access found that all MCOs conduct ongoing analysis of the adequacy of provider networks, both for primary and specialty care. Member utilization of services and geo-access reports are used to identify providers with open networks to ensure that adequate numbers of providers are available to meet the needs of the population. Care coordination and disease management programs are aimed at identifying members with special needs, or those who are non-compliant with care, to provide additional assistance in accessing needed services and improving health status. MCOs met all operational standards relative to access for CY 2011; therefore, action plans were not required based on the prior year's findings.

Adult access to PCPs fell below the national HEDIS Medicaid average for MY 2012 and showed a slight decline over MY 2011 rates. However, measures for access to preventive and well-child services have shown improvement over prior years with 7 of the 12 child measures achieving or exceeding the national Medicaid averages. MCOs performed well above the national Medicaid average for annual dental visits, lead screening, well child visits ages 3-6, and adolescent well-care and immunizations.

Adult satisfaction with “getting needed care” improved substantially (7 percentage points) over MY 2011 rates. Parent/guardian satisfaction with “getting needed care” for child enrollees improved over MY 2011 by nearly 10 percentage points.

Timeliness

Timeliness is an important factor for evaluating MCO performance. Procedures must be in place to make timely decisions in order not to disrupt or delay the provision of care or services to members. An evaluation of the MCOs’ operational systems relative to timeliness found that all MCOs monitor authorization decisions for timeliness. Turn-around time is measured and documented with results summarized and reported to the designated QI/UM committee. However, the CY 2011 findings identified several opportunities for improvement in the MCOs’ structure and operational processes for timely notification of decisions to members, timely resolution of grievances, and availability of provider appointments within the District’s specified timeframes. All MCOs submitted action plans for review and approval by Delmarva. Action plans were implemented and monitored until the identified issues were resolved.

HEDIS measures for timeliness of prenatal care and the frequency with which pregnant women accessed on-going prenatal care fell short of the national Medicaid averages. CAHPS results for satisfaction with getting care quickly declined approximately 4 percentage points for adults, while satisfaction with getting care quickly rose approximately 5½ percentage points for children.

Status of Recommendations from Prior Year

MCOs

As a result of the CY 2011 review activities several recommendations for improvement were made to the MCOs. The MCOs were expected to act on the recommendations during CY 2012. The status of each recommendation is addressed below:

- MCOs must ensure that written policies and procedures encompass all required federal and contractual language. During the CY 2011 review, MCO A was found to be non-compliant with requirements for timely notification to members when availability of after-hours services changed and for timely notifications of denials in accordance with the District’s requirements. An action plan was developed and implemented by MCO A and this issue was resolved.
- MCO B did not meet requirements for notifying members of changes to the provider network in a timely manner and did not meet requirements for timely notification of denials in accordance with the District’s requirements. An action plan was developed and implemented. Monitoring of reports indicate that these issues have been resolved.

MCO C did not meet requirements for its providers for timely access to care and services, taking into account the urgency of need for services. An evaluation of the MCO's provider surveys found that appointments for asymptomatic health assessments including adult physicals and EPSDT services were compliant only 70% of the time for appointments within 3 weeks. Appointments for routine symptomatic care were available within 10 business days 80% of the time. MCO C also did not meet timeliness requirements for resolving grievances. An action plan was developed and implemented.

- MCOs must ensure that PIP activities include a robust analysis of performance for each indicator and tie results to specific interventions. This should include a drill down of data to develop system-wide interventions that may help to sustain improvement. MCOs submitted CY 2012 PIP reports to Delmarva in July 2013 for review and evaluation. By this point in time, two of the MCOs (MCO A and MCO C) participating in CY 2012 activities had been notified that they did not successfully secure new DHCF contracts to provide services to the District's Medicaid enrollees. Therefore, more robust analysis of PIP data were not undertaken by these two MCOs. MCO B continued to conduct robust data analysis of PIPs results and to develop multi-faceted approaches to quality improvement based on data findings.
- MCOs should evaluate HEDIS outcomes measures in relationship to PIP results. Two of the MCOs (MCO A and MCO C) participating in CY 2012 activities were notified that they did not successfully secure new DHCF contracts to provide services to the District's Medicaid enrollees. Therefore, evaluation of HEDIS outcomes measures in relationship to PIP results were not undertaken by these two MCOs. However, within its PIP report, MCO B did include HEDIS data relative to the PIP indicators.
- MCOs should set goals and develop interventions to achieve, at a minimum, the Medicaid average for HEDIS comprehensive diabetes care and controlling high blood pressure measures. All three (3) MCOs improved in nearly all HEDIS measures comprehensive diabetes care. MCO B and MCO C also improved in the controlling high blood pressure measure. MCO A did not submit HEDIS data for controlling high blood pressure.
- MCOs should conduct a root cause analysis tied to CAHPS results to identify reasons for member dissatisfaction, particularly in the areas of customer service and care coordination. MCO A did not conduct a CAHPS survey for CY 2012. MCO B improved in both both care coordination and customer service in its child population. CY 2012 was the first year that MCO B had a large enough population to field the adult survey. MCO C improved in care coordination and customer service in both the child and adult populations.

DHCF

As a result of EQRO activities conducted for CY 2011, Delmarva made the following recommendations to DHCF for program improvement:

- Consider designing and implementing a robust value-based purchasing plan consisting of incentives/disincentives based on MCOs' performance across a designated set of performance measures. DHCF is actively working with its actuary to develop a value-based purchasing program. DHCF began contracting with three (3) new MCOs on July 1, 2013. Therefore, it is not expected that data will be available until FY 2015 to implement a value-based purchasing program.
- Choose a subset of HEDIS, CAHPS, and operational measures that align with DHCF's Strategic Plan and set specific goals against which MCO performance will be assessed annually. These should include goals such as adult access to preventive services, child access to preventive services, quality outcomes related to chronic illnesses, care coordination, and member satisfaction. DHCF is currently in the process of revising its Strategic Plan to incorporate specific goals for MCO performance.
- Use performance against the designated measures as the basis for a consumer report card. DHCF plans to implement the consumer report card in FY 2015 when data becomes available.
- Re-evaluate the current collaborative PIP structure to expand the stakeholders group and add measures more closely tied to health outcomes. The collaborative PIP efforts include monthly meetings with stakeholders who have a direct interest in improving health outcomes in the District, among these are MCOs, physicians, clinics, hospitals, and special interest organizations like the American Diabetes Association. The purpose of these stakeholder meetings is to identify resources and potential interventions that promote improved health outcomes. Over the course of the collaborative activities, stakeholder participation has declined. In order to effect system-wide improvement it is important to receive input and recommendations from a wide variety of service providers. DHCF began working with the newly contracted MCOs in September 2013 to restructure the collaboratives and revise the measure indicators. Several local asthma coalitions have begun actively participating in the collaborative work groups.
- Consider gauging MCO performance separately for the collaborative PIPs. Aggregation of results may be skewed by including rates from one MCO that only serves a special needs population. This recommendation remains under consideration by DHCF and the collaborative work group.

As noted above, DHCF is actively working to address the recommendations from CY 2012. However, implementation of program changes that may result from these recommendations are not expected to occur

until FY 2015. DHCF issued a request for proposals in CY 2012 to procure new MCO contracts. New MCOs began program participation in July 2013. It is not expected that MCOs will have adequate data available to implement incentive based performance or a consumer report card until FY 2015. DHCF is currently reviewing its Strategic Plan for possible revisions to include performance goals for HEDIS and CAHPS measures, a value-based purchasing plan, and use of a consumer report card.

In regards to the collaborative PIPs, DHCF continues to require MCOs to participate in two collaborative PIPs. Both collaborative work groups are focused on reviewing and potentially revising the PIP focus and indicators. Additional stakeholders have been identified and have begun actively participating in collaborative efforts to re-structure the PIPs. DHCF, in conjunction with the work groups, will determine whether separate MCO rates for the indicators will be reported versus an overall District rate dependent upon the final indicators chosen. It is expected that CY 2014 data, which will be reported in June 2015, will be used to construct baseline rates for both collaboratives.

Opportunities for Improvement

Recommendations for MCOs

Although each health plan is committed to delivering high quality care and services to its managed care members, opportunities exist for continued performance improvement. Based upon the evaluation of 2012 activities, and recognizing that MCO A and MCO C will exit the District Medicaid market in 2013, Delmarva developed the following recommendations for MCO B:

- Renew efforts to obtain stakeholder involvement in the collaborative PIPs.
- Identify and leverage current quality improvement efforts underway in the District that support the collaborative aims.
- For future PIPs, tie proposed interventions to data points to enable analysis of the effectiveness of the interventions.

Recommendations for DHCF

Considering all the results for measures of quality, access and timeliness of care for the contracted health plans, Delmarva developed the following recommendations for DHCF:

- Set performance improvement goals for each MCO for key PIP indicators. This will improve MCO accountability and engagement in collaborative efforts.
- Consider expanding the perinatal collaborative indicators to include a new measure of deliveries prior to 39 weeks gestation.

- Set minimum performance goals for health plans on select HEDIS and CAHPS measures. These should include an array of measures pertinent to the District's enrolled managed care population. In particular, we would recommend that measure goals be set for diabetes and prenatal care.
- Link all goals to DHCF's Strategic Plan.

The status of implementation of recommendations made to the MCO and to DHCF will be addressed in the CY 2013 Annual Technical Report.

Best and Emerging Practices

The health plans effectively and collaboratively addressed quality, timeliness and access to care issues in their respective managed care populations. The health plans implemented several best practices strategies which are noted below.

- MCOs tied provider payment and incentives to timely completion and submission of the perinatal risk assessment form.
- Outsourced case management of high-risk members to an organization specializing in this type of intense case management.
- Extended outreach staff hours to provide increased case management services during hours when members might be more easily contacted.
- Developed a multi-disciplinary team of behavioral health specialists, case managers, and social workers to focus efforts on members with co-existing mental health issues or classified as high risk.
- Utilized co-management of pregnant members by an OB case manager and the members pre-pregnancy case manager.
- Increased the frequency of obtaining and analyzing laboratory data from monthly to weekly to identify members with chronic conditions or pregnancy earlier.
- Received weekly census reports from largest participating OB provider for earlier identification of pregnant members.
- Monitored after hours nurse triage line utilization for follow-up of members.
- Initiated a Pharmaceutical Adherence Program to track medication compliance and to send reminders when members did not obtain a refill within the appropriate time span.
- Sent providers case listings of all members identified with a chronic condition.
- Sent providers notification of members utilizing the emergency department 3 or more times in a 6 month period.
- Developed disease management toolkit for members with chronic illnesses.
- Established "Health Navigators" for face-to-face contact with members who are hard to reach.

**DISTRICT OF COLUMBIA
DEPARTMENT OF HEALTH CARE FINANCE
IMPROVING BIRTH OUTCOMES
PERINATAL MEASURE SPECIFICATION AND INSTRUCTIONS
MY 2011 Perinatal Measure Specification**

The District of Columbia (DC) Department of Health Care Finance (DHCF) measures selected perinatal outcomes as part of a multiyear initiative to improve the health of infants born to mothers in the DC Medicaid program.

This measure predominantly assesses health care outcomes, as opposed to certain aspects of the delivery (processes) of health care. Because of this, and because nearly all pregnant women and infants in DC Medicaid are enrolled in managed care as opposed to fee-for-service health care, the unit of analysis will be DHCF's managed care program as a whole, as opposed to individual managed care plans. Although individual managed care organizations (MCOs) that deliver service to DC Medicaid members have and will continue to implement quality improvement (QI) initiatives in perinatal health and report the outcomes of these initiatives to DHCF, individual managed care plan performance on this outcome measure is not publicly reported. Thus, no risk adjustment is required, as is the case when health outcomes are compared across individual providers. Specifications for the perinatal measure are outlined below.

Measure Specifications

TITLE: Adverse Perinatal Outcomes: The rate of adverse perinatal events (as defined below) that occurred among pregnancies ending in each calendar year, and infants ages 0-365 days in the same calendar year. Adverse events are defined as:

- neonates with birth weight less than 2,500 grams;
- neonates of 32 weeks or less gestational age;
- pregnant women NOT tested for HIV prior to giving birth;
- pregnancies ending in miscarriage or fetal loss (early or late);
- pregnancies for which no outcome is known; and
- death of infant ages 0-365 days.

DESCRIPTION

This measure tracks the outcomes of all pregnancies (i.e., those that end in a live birth as well as those that end in a miscarriage or fetal loss) and infant deaths among DC Medicaid managed care enrollees, and determines the rate at which:

- 1) pregnancies ended with: fetal or infant death; a neonate with low birth weight (less than 2,500 g) or who are severely preterm (less than 32 weeks gestation); or with NO testing for the HIV status of the mother prior to delivery; and

2) infant death occurred in the first year of life.

In addition, when a managed care plan does not have data on the outcome of the pregnancy, this is included as an adverse outcome.

Because this measure calculates rates of adverse events, we seek to achieve reductions in this rate from year to year.

RATIONALE

Approximately 7,900 babies are born in the District of Columbia each year; the Medicaid program pays for nearly two-thirds of these. Of all births in DC, 11.2 percent are born at low birth weight (less than 2,500 g) and 3.3 percent are born very preterm (less than 32 completed weeks of gestation)¹⁵ placing them at increased risk for neuro-developmental handicaps, respiratory illness, the need for long term hospitalizations and long term learning difficulties.¹⁶ Twelve babies out of every 1,000 live births die before their first birthday.¹⁷ Among HIV infected mothers the rate of perinatal transmission is 25 percent without treatment and 2 percent or less with treatment.¹⁸ In D.C. in 2006, only 20 percent of HIV infected mothers whose children were perinatally infected had been tested before or during the birth of the child.¹⁹

Among District residents wide disparities exist across the city in infant mortality rates. For instance, in 2005 Ward 3 reported the lowest infant mortality rate (5.3 out of 1,000 live births) and Ward 8 reported the highest (21.7 out of 1,000).²⁰ Nationally, the rate of infant mortality among African Americans is more than twice that of Caucasians (13.6 vs. 5.7 per 1,000 live births in 2004). Much of the discrepancy between infant mortality rates among African Americans and Caucasians can be explained by discrepancies in prematurity and low birth weight rates.²¹ African American women are twice as likely to give birth to a low birth weight infant as compared to Caucasian women, and one and a half times more likely to deliver preterm.²² Other factors contributing to the discrepancy in infant mortality between African Americans and Caucasians include sudden infant death syndrome, infections, congenital abnormalities, and injuries.²³

Although causes of poor pregnancy outcomes are complex and multifactorial, evidence exists that many are preventable with interventions aimed at reducing risks during pregnancy and improving quality of prenatal care. There are a number of evidence-based interventions to reduce poor pregnancy outcomes.

Early, comprehensive prenatal care has been shown to promote healthier pregnancies by early detection of risk factors, by monitoring symptoms, and by providing health behavior advice and education.^{24, 25} In 2005 the national infant mortality rate for infants whose mothers began prenatal care either after the first trimester or not at all was 40 percent higher than the rate for infants whose mothers began care in the first trimester (8.69 deaths per 1,000 live births compared to 6.2 deaths per 1,000 live births).²⁶ Prenatal care is especially important in the presence of birth complications.²⁷ Yet in DC only 69 percent of women receive prenatal care in the first trimester. Among African Americans, the number of women receiving prenatal care in the first trimester is only 62 percent compared to 91 percent among Caucasian women.²⁸

Good evidence also suggests that nurse home visiting programs²⁹ and other programs which include regular home visits with education and parental support³⁰ can result in earlier and more frequent well-baby visits, and longer intervals between births. These interventions are especially effective for women with few economic and social resources.³¹ Improving rates of prenatal care visits have been shown to have a more marked effect on improving birth outcomes in the African American patient population than the Caucasian patient population.³²

By employing multidisciplinary prenatal interventions (e.g., care coordination, nutrition counseling, or psychosocial counseling) targeted toward specific risks (smoking, inadequate weight gain, psychosocial

problems), reductions in the rate of low birth-weight births have been achieved.³³ Other prenatal psychosocial care programs have shown reductions in reducing the number of risk factors reported postpartum,³⁴ in reducing low birth weight among HIV-infected women,³⁵ among pregnant adolescents,³⁶ and among medically high-risk women.³⁷

Smoking is a significant risk factor for several poor pregnancy outcomes. For sudden infant death syndrome (SIDS), a condition responsible for more infant deaths in the United States than any other cause of death during infancy beyond the neonatal period,³⁸ maternal smoking during pregnancy has been identified as a major risk factor.³⁹ Mothers who smoke during pregnancy are up to three times as likely to have a baby die from SIDS as mothers who are nonsmokers.⁴⁰ Smoking during pregnancy nearly doubles a woman's risk of having a low-birth weight baby and increases the likelihood of preterm delivery.⁴¹ According to the US Public Health Service, if all pregnant women in the U.S. stopped smoking there would be an estimated eleven percent (11 percent) drop in stillbirths and a five percent (5 percent) reduction in newborn deaths.⁴²

Effective smoking cessation interventions are available,⁴³ ranging from brief counseling interventions to long-term support programs, and have been shown to reduce preterm birth and low birth weights.⁴⁴ Pregnant women who receive brief smoking cessation counseling are more likely to quit smoking.⁴⁵ A combination of social support and rewards to reduce smoking during pregnancy has proven to be especially effective for high risk pregnant smokers.⁴⁶

Alcohol and illicit drug use during pregnancy are significant and preventable risk factors for preterm birth/low birth weight, and infant mortality.⁴⁷ Drinking alcohol during pregnancy increases the risk for miscarriage and premature birth and may be linked to stillbirth.⁴⁸ Validated screening tools for identifying women from all racial and ethnic groups who might be consuming alcohol at risky levels are available.⁴⁹ Randomized controlled trials have demonstrated that interventions to reduce alcohol use in pregnant women are effective.⁵⁰ A study of nearly 7000 pregnant women who were screened for alcohol and other drug use during routine prenatal care visits and received even a single brief intervention demonstrated a reduced rate of low birth weight and preterm infants⁵¹.

In one study, pregnant women enrolled in the Supplemental Nutrition Program for Women, Infants, and Children (WIC) program who received education and cognitive-behavioral interventions were five times more likely to be abstinent by the third trimester and had fetal mortality rates one-third those of the control group (0.9 percent compared to 2.9 percent).⁵² Contingency management has been successful at improving retention of pregnant women in illicit drug treatment programs and transiently reducing illicit drug use.⁵³ Even minimal drug interventions (such as methadone maintenance) and counseling, combined with prenatal care, have resulted in improved pregnancy and infant outcomes.⁵⁴

Effective means of reducing perinatal HIV transmission to less than two percent are available.⁵⁵ For this reason, the CDC has recommended prenatal HIV testing for all pregnant women.⁵⁶ Community outreach programs that include on-site HIV and pregnancy testing have been shown to be effective in increasing prenatal HIV testing.⁵⁷

Denominator Description

Note: The denominator has two parts, which must be calculated separately and then added back together.

Denominator Part 1: Include in the denominator of this rate all pregnancies that ended in the measurement year.

NOTE 1: All pregnancies (those that ended in a live birth as well as those that end in a miscarriage or fetal loss) are to be included in the denominator with the exception of ectopic pregnancies and pregnancies terminated through legally and illegally induced abortions. Although Collaborative members are aware that some miscarriages early in pregnancy may not be amenable to intervention, for ease of measurement these pregnancies are included in the denominator.

NOTE 2: There is no continuous enrollment requirement for this measure. Pregnancies that ended in the measurement year are to be included in the denominator regardless of how long the woman was enrolled in the managed care plan prior to the end of the pregnancy. However, because limited enrollment in a managed care program or an individual health plan offers limited opportunities for intervention, data on the length of continuous enrollment of women whose pregnancies ended in the measurement year is also collected along with the rate of Adverse Perinatal Outcomes.

NOTE 3: Use the procedure and diagnosis codes as written. If you think a code is missing or should be considered for inclusion in the measure, please submit the code to poynorl@dfmc.org.

NOTE 4: Some analysts recommend running separate queries for each diagnosis, procedure or CPT code and then eliminating any duplicate counts of pregnancies.

Calculating the Denominator – Part 1

Step 1: Identify all pregnancies that ended in the calendar year, excluding legally and illegally induced abortions and ectopic pregnancies. (Note: A pregnancy ending in multiple births is counted as one pregnancy. Two separate pregnancies ending in the measurement year are each counted in the denominator). Pregnancies that ended are identified by a UB04 or CMS 1500 claim that has any of the following codes in any claim line and in any sequence; e.g., 1st claim line, 2nd claim line etc.

Table 1: Diagnostic or Procedures Codes to Identify Pregnancies that Ended (Denominator)

Description	ICD-9 –CM Diagnosis	ICD-9 Procedures	CPT Procedure Codes
Delivery	640.x1, 641.x1, 642.x1, 642.x2, 643.x1, 644.21, 645.x1, 646.x1, 646.12, 646.22, 646.42, 646.52, 646.62, 646.82, 647.x1, 647.x2, 648.x1, 648.x2, 649.x1, 649.02, 649.12, 649.22, 649.32, 649.42, 649.62 650, 651.x1, 652.x1, 653.x1, 654.x1, 654.02, 654.12, 654.32, 654.42, 654.52, 654.62, 654.72, 654.82, 654.92, 655.x1, 656.x1, 657.01, 658.x1, 659.x1, 660.x1, 661.x1, 662.x1, 663.x1, 664.x1, 665.01, 665.11, 665.22, 665.31, 665.41, 665.51, 665.61, 665.71, 665.72, 665.81, 665.82, 665.91, 665.92, 666.x2, 667.x2, 668.x1, 668.x2, 669.01, 669.02, 669.11, 669.12, 669.21, 669.22, 669.32, 669.41, 669.42, 669.51, 669.61, 669.71, 669.81, 669.82, 669.91, 669.92, 670.x2, 670.12, 670.22, 670.32, 670.82, 671.01, 671.02, 671.11, 671.12, 671.21, 671.22, 671.31, 671.42, 671.51, 671.52, 671.81, 671.82, 671.91, 671.92, 672.02, 673.x1, 673.x2, 674.01, 674.51, 674.x2, 675.x1, 675.x2, 676.x1, 676.x2, V22.x, V23.4x, V23.1, V23.2, V23.3, V23.5, V23.7, V23.8x V24.x, V27.0, V27.1, V27.2, V27.3, V27.4, V27.5, V27.6, V27.7 760.x, 760.xx, 761.x, 762.x, 763.x, 763.8x, 764.xx, 765.xx, 767.x, 767.1x, 768.x, 768.7x, 769.x- V30.x- V39.x* V30.0x-V39.0x	72.0-73.99, 74.0, 74.1, 74.2, 74.4, 74.99	59400, 59409, 59410, 59510, 59514, 59515, 59610, 59612, 59614, 59618, 59620, 59622
Complications related to pregnancy	632 (missed abortion- early fetal death prior to 22 weeks) 634.xx (spontaneous abortion), 637.xx (unspecified abortion), 677, V23.xx, V28.xx, V27.7		59812, 59820, 59821, 59830
Abortion, spontaneous	634.xx		
Newborn care*	V30.x-V39.x*		99466*, 99467*, 99460*,

Description	ICD-9 –CM Diagnosis	ICD-9 Procedures	CPT Procedure Codes
			99461*, 99462* 99464*, 99465*, 99468*, 99469,*99463 (newborn care codes)

**These services are coded to the newborn and should be used by the MCO only to identify a pregnancy of an enrolled woman not otherwise identified by other denominator codes.*

Step 2: Eliminate any duplicate pregnancies:

- If the data identifies the same pregnancy using more than procedure or diagnosis code, **count the pregnancy only once.**
- If the data shows a woman with > 1 delivery within an 8-week period, **count as one pregnancy.**

Denominator exclusions: Exclude from the denominator all pregnancies identified by the diagnosis and procedure codes specified in Table 2.

Table 2: Denominator Exclusions

Description	ICD-9 –CM Diagnosis	ICD-9 Procedures	CPT Codes
Ectopic pregnancy	633.x 633.xx 761.4	74.3	59120,59121,59130,59135,59136,59140,59150
Abortion, legally induced, illegally induced	635.xx, 636.xx	69.51 69.01 69.93 74.91 75.0 96.49	59840, 59841, 59850, 59851, 59852, 59855, 59856, 59857
Hydatiform Mole	630		59100, 59870
Abnormal products of conception	631		
Complications following abortion or ectopic pregnancy	639.x		

Calculating the Denominator - Part 2

The second part of the denominator is a count of all children ages 0-365 days for any part of the measurement year, and who were enrolled in the health plan during the measurement year, regardless of length of enrollment. This second denominator is calculated by counting all children whose date of birth occurred between January 1, of the year prior to measurement year and December 31 of the measurement year (a two year period).

Numerator Description

Two corresponding numerators also are calculated. The first is the total number of the following adverse events associated with pregnancies included in the first denominator:

- 1) miscarriage or fetal loss (at any time during pregnancy)
- 2) neonates weighing <2,500 grams
- 3) neonates of 32 weeks or less gestational age
- 4) pregnancies for which the outcome is unknown
- 5) pregnancy during which NO maternal testing for HIV was performed.

Note: *A single pregnancy can be counted more than once in the numerator. For example, a woman who was never tested for HIV during her pregnancy and **prior to** delivery, and gives birth to twins at 30 weeks gestational age, each twin weighing less than 2,500 grams and one twin dying in the neonatal period is counted as six numerator events: No HIV test during pregnancy = 1, plus two preterm infants, plus two low-birth-weight infants, plus one infant death between the age of 0 and 365 days = six (6) adverse events.*

Calculating the Numerator – Part 1

The first numerator includes two types of adverse events (i.e., adverse outcomes and adverse process of care). A separate step is used to identify each of these two types of numerator events.

Step 1: Identify and Include Adverse Pregnancy Outcomes in the Numerator. From the first denominator population, identify all pregnancies whose claim contained any of the following in any claim line and in any sequence; e.g., 1st claim line, 2nd claim line etc. The total of all such Indicator events are included in the numerator.

Table 3: Codes to Identify Adverse Pregnancy Outcome Numerator Events

Description	ICD-9-CM Diagnosis	CPT	Other Data Source	Notes

Adverse Event Indicator 3 Pregnancies resulting in neonates of 32 weeks or less gestational age ⁵⁸	765.26 (31-32 weeks of gestation) 765.25 (29-30 weeks of gestation) 765.24 (27-28 weeks of gestation) 765.23 (25-26 weeks of gestations) 765.22 (24 weeks of gestation) 765.21 (less than 24 completed weeks of gestation)			
Adverse Event Indicator 4 Pregnancies without evidence of a birth outcome.				

Step 2: Identify and Include in the Numerator Pregnancies in Which the Mother's HIV Status was **not** Determined Prior to the Admission Date for Delivery.

From the denominator, identify all pregnancies whose ambulatory claim data **prior to date of delivery** included: 1) a procedure code/LOINC code for HIV testing⁵⁹; 2) a diagnosis code for HIV or AIDs; or 3) a drug claim for an antiretroviral medication. **NOTE:** A claim for HIV testing during the inpatient stay for the delivery is **not** included.

⁵⁸ The primary means of determining gestational age should be the interval between the first day of the mother's last normal menstrual period (LMP) and the date of birth. When the LMP dating appears to be inconsistent with the birth weight, as when normal weight births of apparently short gestations or very-low-birth weight births reported to be full term, the U.S. Standard Certificate of Live Birth allows the use of "clinical estimate of gestation." The clinical estimate of gestation should also be used when LMPs are not available.

⁵⁹ Although the CDC's HIV screening guideline recommends testing twice during pregnancy (during the first and third trimesters), the measurement standard for the collaborative is only 1 HIV test per pregnancy.

Table 4: Codes to Identify Testing or Identification of HIV Status Prior to Delivery

Description	ICD-9-CM Diagnosis	CPT	NDC Drug Codes	Other Data Source*DC DOH HIV Registry or other administrative data that can be validated	LOINC Codes
Adverse Indicator 5 Pregnancies with evidence of Maternal testing for HIV, diagnosis of HIV prior to delivery, or use of antiretroviral medications	ICD-9 codes for those with diagnoses of HIV or AIDS: 042, 647.6x + V08, and 079.53	86689, 86701-86703, 87534-87539, 87390-87391	See attached list of NDC codes	Health plans can also supplement the identification of mothers whose HIV status was already known prior to delivery by reviewing clinical and / or administrative records of those women whose claims do not show testing for HIV or a diagnosis of HIV or AIDS.	See attached list of LOINC codes

Subtract the pregnancies whose ambulatory claim data included: 1) a diagnosis of HIV or AIDS prior to delivery; or 2) a code for HIV testing prior to delivery (refer to the LOINC code table for laboratory codes); or 3) an NDC code for antiretroviral medication prior to delivery from the denominator total to produce the *number of pregnancies during which NO determination of HIV status was performed prior to the delivery*. Add these women (events) to the first numerator from Step 1.

Calculating the Numerator – Part 2

From the second denominator, identify the number of infant deaths occurring among these infants: These infant deaths are identified as below:

Description of Second Numerator:	ICD-9-CM Diagnosis	Other
Infant death age 0-365 days	674.92, 674.9x, 674.90,) sudden infant death after delivery, cause not stated) 798.x (Cot, Crib death, sudden infant death syndrome) 779.9 (neonatal death)	Review the MCO's Sentinel Event report and Death Reports to detect any cases of infant mortality in the first year of life (aged 0-365 days) and include these deaths in the numerator.

The number of infant deaths age zero to 365 days constitutes a second numerator.

Calculating the Adverse Perinatal Outcome Rate

The Adverse Perinatal Outcomes Rate is calculated by dividing the total of the two numerator events by the total of the two denominators:

$$\frac{\text{Total adverse pregnancy outcomes + infant deaths in 1st year of life}}{\text{All Pregnancies + children age 0-365 days}} = \frac{\text{Adverse outcomes}}{\text{Per 1,000 pregnancies \& infants}}$$

**DISTRICT OF COLUMBIA
DEPARTMENT OF HEALTH CARE FINANCE
IMPROVING ADVERSE OUTCOMES OF CHRONIC DISEASE
MEASURE SPECIFICATION AND INSTRUCTIONS
MY 2011 Chronic Disease Measure Specification**

The District of Columbia (DC) *Collaborative to Improve Chronic Disease Outcomes* is measuring changes in the health outcomes of individuals with asthma, diabetes, hypertension, and congestive heart failure as part of a multiyear initiative to improve the health of people in the DC Medicaid and Alliance programs who live with chronic diseases.

This measure assesses health care outcomes, as opposed to certain aspects of the delivery (processes) of health care. The unit of analysis is the DC Medicaid and Alliance managed care program as a whole, as opposed to individual managed care plans. Although individual managed care plans that deliver service to DC Medicaid and Alliance members have and will continue to implement quality improvement (QI) initiatives to care for individuals with these diseases, and report the outcomes of these initiatives to the DC Department of Health Care Finance (DHCF), *individual* managed care plan performance on the measure described below is not publicly reported. Thus, no risk adjustment is required, as is the case when health outcomes are compared across individual providers. The chronic care measure specifications used to gauge improvement in chronic disease outcomes of Medicaid and Alliance beneficiaries are outlined below.

Measure Specifications

TITLE: Adverse Outcomes of Chronic Disease

DESCRIPTION: The rate of occurrence of emergency room visits and hospitalizations for Medicaid and Alliance managed care plan enrollees with any one, or combination, of the diagnoses of asthma, diabetes, hypertension, or congestive heart failure. The death rate of this population is also measured, separately.

RATIONALE: Chronic diseases are ongoing, generally incurable illnesses or conditions. Some health services research has found that patients suffering from a number of chronic diseases can attain significant improvements in health outcomes when health care is provided in accord with an explicit, evidence-based plan that includes systematic assessments, regular patient follow-up, provider care coordination, and attention to patient self-management needs.ⁱ Proper outpatient care has the potential to reduce the rate of chronic disease exacerbations and complications and thereby reduce hospital utilization as measured by rates of emergency department (ED) encounters and hospitalizations.ⁱⁱ

This measure uses the rate of hospital and ED use by enrollees who have certain chronic diseases common in children and adults as a proxy indicator for chronic disease morbidity. In recognition of the fact that some ED and hospital use is appropriate and unavoidable, the rate of death among this population is also monitored so that if efforts to reduce hospital utilization rates have an unintended consequence of increasing death rates, this result is captured by the data.

Asthma

Multiple studies including randomized controlled trials have consistently shown that asthma is a readily treatable chronic condition that can be managed in the outpatient setting.ⁱⁱⁱ

- Patient education with self-management support and regular medical review significantly reduces hospital admissions, emergency room visits, and unscheduled visits to the doctor.^{iv}
- Adverse outcomes can be reduced in patients by using case management that includes good medical therapy, and patient and parent education and outreach.^v
- Studies looking at reductions in risk of admission provide evidence that inhaled steroid use may decrease risk of admission by 50 percent in adults.^{vi}
- In one study, severely ill adult asthma patients given intensive illness self-management training and vigorous medical therapy had a two-fold decrease in hospital stays compared with controls.^{vii}
- Children who received asthma self-monitoring and management instruction, coordinated follow-up and environmental change interventions in a randomized controlled trial had significantly fewer unscheduled visits for asthma care during follow-up than controls.^{viii}
- Another randomized controlled trial found children who received illness self-management education with or without enrollment in a nurse case-management program experienced 73 percent fewer ED visits and 84 percent fewer hospitalizations (with case-management) and 40 percent reduction in ED visits (with patient self-management alone).^{ix}
- Using coordinated community care networks and case managers when needed, the state of North Carolina improved the quality of asthma care for its Medicaid recipients and decreased utilization of ED visits and hospitalizations for asthma (by 8 percent and 34 percent respectively) in the first year.^x

Relationship to Quality

The causes for hospital admissions in patients with asthma are multi-factorial and may include: poor quality of care, lack of patient compliance, and problems accessing care. All of these factors may be addressed in a comprehensive health care delivery system such as a managed care program. Admission rates for asthma as a quality indicator has been tested and included as part of well-recognized national quality indicator measure sets.^{xi} ED visits also are included in this measure in order to include patients who receive preventable asthma care in the hospital emergency room without being admitted.^{xii}

Diabetes

Diabetes is a chronic condition that can result in life-threatening short-term complications as a result of an excess of glucose (hyperglycemia) or insulin (hypoglycemia) and in long-term complications such as blindness, kidney failure, loss of limb, and heart disease. Long-term diabetes complications are thought to arise from poor control of diabetes over a sustained period. For both short-term and long-term complications, high quality outpatient care has been shown to lead to reductions in hospitalizations.^{xiii}

- At least two randomized controlled trials demonstrate that chronic care intervention (self-management support, individualized goal setting, regular follow-up, and provider decision support) resulted in significant lowering of cardiovascular disease risk factors (HbA1c, blood pressure and cholesterol levels),^{xiv} and/or significant reductions in emergency room visits.^{xv}

- In an analysis of hospital utilization rates among 18,404 adult Medicaid recipients receiving primary care at eight different clinics, having had any type of educational visit for diabetes self-care was associated with 9.18 fewer hospitalizations per 100 person years and \$11,571 less in hospital charges per person after adjusting for other variables.^{xvi}
- In a study designed to assess the impact of improved glycemic control on diabetic complications in managed care patients, patients with better glycemic control experienced reduced hospital admissions for both acute and chronic diabetic complications and corresponding reductions in mean adjusted hospital costs.^{xvii}
- The United Kingdom prospective diabetes study (UKPDS) provided evidence that intensive blood glucose control with sulfonylureas or insulin was superior to traditional (mainly diet) management of patients with type II diabetes; both the number and duration of hospitalizations were reduced because of lower complication rates among intensively treated patients compared to controls. Treatment included combination medication therapies in addition to diet and self management and monitoring.^{xviii}
- A systematic review of 26 studies addressing diabetes self-management training and education found that more than half (18) were associated with decreased cost, cost saving, cost-effectiveness or positive return on investment;^{xix}
- Intensive diabetes therapy reduces the risk of development of microalbuminuria and progression to kidney disease people with type I and type II diabetes.^{xx}
- In a review of studies in which elements of the chronic care model were employed, 19 out of 20 interventions improved a process or outcome of care.^{xxi}

Relationship to Quality

Hospital admission rates for short-term or long-term complications of diabetes may be the result of poor quality medical care, noncompliance of patients, lack of education, or access to care. Because proper outpatient treatment and adherence to care may reduce the incidence of long-term diabetic complications, admission rates for diabetic emergencies and for long-term diabetic complications are included in well-established sets of prevention quality indicators.^{xxii}

Congestive Heart Failure

Congestive heart failure is a chronic progressive disorder which can be controlled in an outpatient setting for the most part, but for which some hospitalizations are appropriate.

- Analysis of data from 10 randomized clinical trials of care management programs for heart failure carried out in the United States, Australia, the Netherlands and the United Kingdom, found that hospital readmissions could be reduced by 25 percent and total readmission days by 30 percent when care management methods included a multi-disciplinary team approach and in-person communication with patients.^{xxiii}
- Randomized controlled trials demonstrate 30 – 56 percent reduction in hospital readmissions for congestive heart failure^{xxiv} and 18 percent reduction in mortality when chronic care model interventions (i.e., patient education with home visit follow-up post hospitalization) are used.^{xxv}

Self-management interventions alone can result in significant reductions in all-cause hospital readmissions and heart failure readmission with reported cost savings ranging from \$1,300 to \$7,515 per patient per year; however, this study found the effect on mortality is not significant.^{xxvi}

Relationship to Quality

High admission rates for congestive heart failure may reflect problems with poor quality care, poor patient compliance with care, or problems accessing care. Because hospital admission rates for congestive heart failure have been shown to respond to interventions such as the use of protocols for ambulatory management of low-severity patients and facilitation of access to outpatient care, hospital admission rates for congestive heart failure has been adopted by the Institute of Medicine as a “Priority Area for National Action” and is included in their 2003 publication “Transforming Health Care Quality”^{xxvii}.

Hypertension

Patients with hypertension are at risk for stroke, heart disease and other cardiovascular problems such as kidney failure, impotence, and problems with poor blood supply to the feet and legs. The decrease in life expectancy for persons with high blood pressure is 5.1 years for men and 4.9 years for women.^{xxviii} Hypertension is being increasingly recognized in children and adolescents with approximately 5 percent of children and adolescents having essential hypertension.^{xxix}

- At least one large randomized clinical trial using the chronic care model has demonstrated a 17 percent reduction in all-cause mortality when chronic care elements are incorporated into care.^{xxx}
- Antihypertensive therapy is associated with a 35 to 40 percent reduction in stroke incidence, 20 to 25 percent reduction in heart attack and a more than 50 percent reduction in heart failure.^{xxxi}
- Based on results of a large study, reducing blood pressure by 5 mmHg is estimated to decrease deaths due to stroke by 14 percent, death due to coronary heart disease by 9 percent and death from all causes by 7 percent.^{xxxii}
- Early detection and control of hypertension has been shown to slow the onset and progression of renal failure due to high blood pressure.^{xxxiii}

Relationship to Quality

Appropriate outpatient care is often successful in controlling hypertension and may lower rates of ED visits and hospitalizations for hypertension. Outpatient management of hypertension has been adopted by the Institute of Medicine as a “Priority Area for National Action” and is included in its 2003 publication “Transforming Health Care Quality.”^{xxxiv}

Denominator Description

Include in the denominator of this rate all enrollees with one or more of the following diagnoses during the measurement year: diabetes, asthma, congestive heart failure, and hypertension.

NOTE: There is no continuous enrollment requirement for inclusion in the denominator.

A member is identified as having a diagnosis of diabetes, asthma, congestive heart failure, or hypertension by the presence of at least one specific diagnosis code on any claim or encounter form generated from at least one ambulatory care or ED visit or inpatient stay. An enrollee with any of these codes should be counted only once in the denominator.

Note 1: Coding to identify enrollees with the diagnoses of interest and to identify exclusions is based on the Agency for Healthcare Research and Quality’s (AHRQ’s) Prevention Quality Indicators set.^{xxxv} This indicator set was chosen for two reasons: 1) it is designed to be calculated using routinely collected, readily available hospital administrative data, and 2) it is

widely used by other states, which indicates its feasibility and facilitates meaningful comparisons with national and regional data.

Note 2: Use the procedure and diagnosis codes as written. If you think a code is missing or should be considered for inclusion in the measure, please submit the code to poynorl@dfmc.org

Calculating the Denominator

Step 1: Identify all individuals with any of the conditions of interest. Identify all enrollees in the indicated age categories **during the measurement year** with a UB04 or CMS 1500 claim or encounter form containing any of the diagnosis codes listed in Table 1 in any position, in any claim line and in any sequence; e.g., 1st claim line, 2nd claim line etc.

Step 2: Eliminate duplicates. Any individual identified more than once because more than one claim contained any combination of the codes above should be counted only once in the denominator population.

The denominator consists of all individuals identified in Step 1 (counted only once, per Step 2).

Table 1.

Age in the Measurement Period	Description	ICD-9-CM Diagnosis	Denominator Exclusions	Denominator Exclusion Codes (ICD-9-CM Codes)
6-75 years	Diabetes mellitus	250,	Polycystic Ovarian Disease	256.4
	Diabetic neuropathy	250.x, 250.xx	Steroid induced	251.8, 962.0
	Diabetic retinopathy	357.2, 362.0x	Gestational Diabetes	648.8
	Diabetic cataract	366.41	Diabetes Insipidus	253.5
		*		
2-50 years	Asthma	493,	COPD	491.2x, 493.2x, 496, 506.4
		493.x		
		493.0x	Emphysema	492.x, 506.4, 518.1, 518.2
		493.1x		
		493.8x	Cystic Fibrosis	277.xx
		493.9x		
			Lung Anomalies	
			Congenital	748.6x

			Esophageal Fistula	750.3
			Situs Inversus	759.3
			Perinatal Chronic Resp Disease	770.7
			Anomalies of the Aortic Arch	747.21
18- 85 years	Hypertension - malignant, benign, or unspecified	401.x 402.xx 403.xx	ESRD	585.5, 585.6, V42.0, V45.1x, V56.x
	Hypertensive Heart Disease	404.xx	Pre-eclampsia	642.4x mild pre-eclampsia 642.5x severe pre-eclampsia
	Hypertensive Chronic Kidney Disease		Eclampsia	642.6x eclampsia 642.7x pre-eclampsia or eclampsia
	Hypertensive heart and Chronic Kidney Disease		Renovascular Hypertension Benign or Malignant	642.9xUnspecified hypertension complicating pregnancy 405.11 405.01
18-75 years	Congestive Heart Failure	428.0, 428.1,	None	None
	Left Heart Failure	428.2x		
	Systolic Heart Failure	428.3x 428.4x		
	Diastolic Heart Failure	428.9		
	Combined Systolic/Diastolic Heart Failure			

Numerator Description

The numerator consists of the number of ED visits with a *discharge* diagnosis of diabetes, hypertension, asthma, or congestive heart failure, plus the number of hospitalizations with a *discharge* diagnosis of diabetes, hypertension, asthma, or congestive heart failure among enrollees in the denominator. Visits or hospitalizations are identified by claim/encounter data generated from the institution providing care to Medicaid and Alliance members.

Note: Numerator events (i.e., ED visits and hospital admissions) may occur multiple times for a single individual. When this occurs, each ED visit and hospitalization is counted separately. For example, an individual identified in the denominator

might have three ED visits and two hospitalizations during the measurement year. This person would be counted once in the denominator, but account for five numerator events.

Calculating the Numerator

Step 1. Identify all enrollees in the denominator who had one or more emergency visits or inpatient stays. From the denominator, identify all enrollees with a claim/encounter containing any of the codes in Table 2 in any claim line and in any sequence; e.g., 1st claim line, 2nd claim line etc.

Table 2.

Codes to Identify ED Visits or Inpatient Admissions	CPT	UB Revenue
Emergency Department encounter	99281-99285	045x, 0981
Hospital Admission Acute inpatient	99221-99223, 99231-99233, 99238, 99239, 99251-99255, 99291, 99234, 99235, 99236	010x, 0110-0114, 0119, 0120-0124, 0129, 0130- 0134, 0139, 0140-0144, 0149, 0150-01534, 0159, 016x, 020x-022x, 072x, 080x, 0987

Step 2. Identify All ED or Inpatient Encounters for the Conditions of Interest. For individuals identified in Step1 with one or more ED or inpatient claims / encounters, count all ED or inpatient encounters with an ED or inpatient discharge diagnosis with the codes in Table 3 in a any claim line and in any sequence e.g. 1st claim line, 2nd claim line etc.

Table 3.

Codes to Identify ED or Inpatient Claims / Encounters for Diabetes, Asthma, Hypertension, and Congestive Heart Failure	ICD-9-CM Diagnosis Codes
Diabetes mellitus	250, 250.x, 250.xx
Asthma	493, 493.x, 493.0x, 493.1x 493.8x, 493.9x
Hypertension - malignant, benign, or unspecified	401.x
Hypertensive Heart Disease	402.xx
Hypertensive Chronic Kidney Disease	403.xx
Hypertensive heart and Chronic Kidney Disease	404.xx
Congestive Heart Failure	428.0,
Left Heart Failure	428.1,
Systolic Heart Failure	428.2x,
Diastolic Heart Failure	428.3x,
Combined Systolic/Diastolic Heart Failure	428.4x, 428.9

Step 3. Identify Exclusions

From all ED and inpatient encounters for the conditions of interest identified in Step 2, identify all of the following inpatient admissions and ED visits, for exclusion from the numerator:

- a. *Facility transfers:* Patients transferring from another institution – Exclude all claims / encounters with Admission Source Code of either “4” (Transfer from a hospital) or “6” (Transfer from another health care facility) in Field #15 of a UB04 Claim; and
- b. *Admissions to non-acute facilities:* Non acute admissions to nursing homes – Exclude all claims / encounters with the CPT or Revenue Codes in the claim or encounter form in Table 4:

Table 4.

Non-acute inpatient	CPT Codes	Revenue Codes
	99304-99310, 99315, 99316, 99318, 99324-99328 99334-99337	0118, 0128, 0138, 0148, 0158, 019x, 0524, 0525, 055x, 066x

- c. *Congestive Heart Failure and Hypertension* - For individuals with a congestive heart failure and/or a hypertension diagnosis, exclude claims/encounters with the cardiac procedure codes in any field in Table 5.

d. E-Code Exclusions

Identify encounters that may not be caused by the chronic condition such as motor vehicle accidents. A list of E-codes is included in Table 6.

Table 6.

E Codes	Narrative	Code
	Railway accident involving collision with rolling stock	E800.x
	Railway accident involving collision with other object	E801.x
	Railway accident involving derailment without antecedent collision	E802.x
	Railway accident involving explosion, fire, or burning	E803.x
	Fall in, on, or from railway train	E804.x
	Hit by rolling stock	E805.x
	Other specified railway accident	E806.x
	Railway accident of unspecified nature	E807.x
	Motor vehicle traffic accident involving collision with train	E810.x
	Motor vehicle traffic accident involving re-entrant collision with another motor vehicle	E811.x
	Other motor vehicle traffic accident involving collision with motor vehicle	E812.x
	Motor vehicle traffic accident involving collision with other vehicle	E813.x
	Motor vehicle traffic accident involving collision with pedestrian	E814.x
	Other motor vehicle traffic accident involving collision on the highway	E815.x

E Codes Narrative	Code
Motor vehicle traffic accident due to loss of control, without collision on the highway	E816.x
Noncollision motor vehicle traffic accident while boarding or alighting	E817.x
Other noncollision motor vehicle traffic accident	E818.x
Motor vehicle traffic accident of unspecified nature	E819.x
Nontraffic accident involving motor-driven snow vehicle	E820.x
Nontraffic accident involving other off-road motor vehicle	E821.x
Other motor vehicle nontraffic accident involving collision with moving object	E822.x
Other motor vehicle nontraffic accident involving collision with stationary object	E823.x
Other motor vehicle nontraffic accident while boarding and alighting	E824.x
Other motor vehicle nontraffic accident of other and unspecified nature	E825.x
Pedal MYcle accident	E826.x
Animal-drawn vehicle accident	E827.x
Accident involving animal being ridden	E828.x
Other road vehicle accidents	E829.x
Accident to watercraft causing submersion	E830.x
Accident to watercraft causing other injury	E831.x
Other accidental submersion or drowning in water transport accident	E832.x
Fall on stairs or ladders in water transport	E833.x
Other fall from one level to another in water transport	E834.x
Other and unspecified fall in water transport	E835.x
Machinery accident in water transport	E836.x
Explosion, fire, or burning in watercraft	E837.x
Other and unspecified water transport accident	E838.x
Accident to powered aircraft at takeoff or landing	E840.x
Accident to powered aircraft, other and unspecified	E841.x
Accident to unpowered aircraft	E842.x
Fall in, on, or from aircraft	E843.x
Other specified air transport accidents	E844.x

E Codes Narrative	Code
Accident involving spacecraft	E845.x
Accidents involving powered vehicles used solely within the buildings and premises of industrial or commercial establishment	E846
Accidents involving cable cars not running on rails	E847
Accidents involving other vehicles, not elsewhere classifiable	E848
Accidents by fire or flame	E890.x
E890.0 Explosion caused by conflagration	E890.0
E890.1 Fumes from combustion of polyvinylchloride [PVC] and similar material in conflagration	E890.1

E928.9 Unspecified accident	E928.9

- e. Pregnancy Exclusions
Identify encounters due to birth/delivery. A list of birth/delivery codes is included in Table 7.

Table 7. Delivery Codes

ICD-9 –CM Diagnosis	ICD-9 Procedures	CPT Procedure Codes
640.x1, 641.x1, 642.x1, 642.x2, 643.x1, 644.21, 645.x1, 646.x1, 646.12, 646.22, 646.42, 646.52, 646.62, 646.82, 647.x1, 647.x2, 648.x1, 648.x2, 649.x1, 649.02, 649.12, 649.22, 649.32, 649.42, 649.62, 650, 651.x1, 652.x1, 653.x1, 654.x1, 654.02, 654.12, 654.32, 654.42, 654.52, 654.62, 654.72, 654.82, 654.92, 655.x1, , 656.x1, 657.01, 658.x1, 659.x1, 660.x1, 661.x1, 662.x1, 663.x1, 664.x1, 665.01, 665.11, 665.22, 665.31, 665.41, 665.51, 665.61, 665.71, 665.72, 665.81, 665.82, 665.91, 665.92, 666.x2, 667.x2, 668.x1, 668.x2, 669.01, 669.02, 669.11, 669.12, 669.21, 669.22, 669.32, 669.41, 669.42, 669.51, 669.61, 669.71, 669.81, 669.82, 669.91, 669.92, 670.x2, 670.12, 670.22, 670.32, 670.82, 671.01, 671.02, 671.11, 671.12, 671.21, 671.22, 671.31, 671.42, 671.51, 671.52, 671.81, 671.82, 671.91, 671.92, 672.02, 673.x1, 673.x2, 674.01, 674.51, 674.x2, 675.x1, 675.x2, 676.x1, 676.x2, V22.x, V23.x, V24.x, V27.0, V27.1, V27.2, V27.3, V27.4, V27.5, V27.6, V27.7 760.x, 760.6x, 760.7x, 761.x, 762.x, 763.x, 763.8x, 764.xx, 765.xx, 767.x, 767.1x, 768.x, 768.7x, 769.x- V30.x- V39.x V30.0x-V39.0x	72.0-73.99, 74.0, 74.1, 74.2, 74.4, 74.99	59400, 59409, 59410, 59510, 59514, 59515, 59610, 59612, 59614, 59618, 59620, 59622

Step 4. Calculate the Numerator

Subtract the encounters identified in Step 3, above, from those identified in Step 2. These are the numerator events.

Step 5. Calculate the Rate of Adverse Chronic Disease Outcomes

The annual rate of Adverse Outcomes of Chronic Disease is calculated by dividing the number of numerator events by the number of individuals in the denominator, and is expressed as.

The Number of Adverse Outcomes

Per 1,000 individuals with asthma, hypertension, diabetes and/or congestive heart failure

Step 6. Calculate the Death Rate

From the sentinel events report submitted to DHCF, identify any individuals in the denominator population who have died during the measurement year. This is a second numerator. Divide this numerator by the denominator above. This death rate is tracked along with the *Rate of Adverse Chronic Disease Outcomes* to assess whether efforts to reduce unnecessary ED and inpatient encounters have any unintended adverse consequences.

ⁱThese elements comprise the Chronic Care Model; see Bodenheimer T, Wagner E, Grumbach K. Improving primary care for patients with chronic illness: the chronic care model. *JAMA* 2002; 288:1775-1779.

ⁱⁱNot all chronic disease management efforts have the same ability to improve outcomes. For example, review of 15 Medicare demonstration projects designed to measure the effect of care coordination by itself on hospital utilization, found that the two projects that were judged to have the potential to generate savings from less frequent hospitalizations had important attributes not found in the other studies: first the care coordinators interacted in person with patients, not by telephone, and second the care coordinators collaborated closely with patients' physicians, most often by being located in the physicians' offices.
